Scan Report

January 26, 2026

Summary

This document reports on the results of an automatic security scan. All dates are displayed using the timezone "Coordinated Universal Time", which is abbreviated "UTC". The task was " hgdfdghgdgd". The scan started at Mon Jan 26 01:47:47 2026 UTC and ended at Mon Jan 26 14:04:13 2026 UTC. The report first summarises the results found. Then, for each host, the report describes every issue found. Please consider the advice given in each description, in order to rectify the issue.

Contents

1 Result Overview **2**
1.1 Host Authentications . . . 5

2 Results per Host **5**
2.1 172.31.1.61 . . . 5
2.1.1 Critical 8161/tcp . . . 6
2.2 172.30.39.1 . . . 20

Vendor security updates are not trusted.
Overrides are off. Even when a result has an override, this report uses the actual threat of the result.
Information on overrides is included in the report.
Notes are included in the report.
This report might not show details of all issues that were found.
Issues with the threat level "Debug" are not shown.

This report contains results 1 to 1000 of the 5586 results selected by the filtering described above. Before filtering there were 5586 results.

1.1 Host Authentications

Host	Protocol	Result	Port/User
172.30.4.1 - sambacry.trabalho_vulnnet	SMB	Success	Protocol SMB, Port 445, User
172.30.1.1 - metasploitable2.trabalho_vulnnet	SMB	Success	Protocol SMB, Port 445, User

2 Results per Host

2.1 172.31.1.61

Host scan start	Mon Jan 26 01:48:40 2026 UTC
Host scan end	Mon Jan 26 03:38:44 2026 UTC

Service (Port)	Threat Level
8161/tcp	Critical

2.1.1 Critical 8161/tcp

Critical (CVSS: 10.0)
NVT: Apache ActiveMQ Web Console Default / No Credentials (HTTP)

Summary
The Apache ActiveMQ Web Console is unprotected or is using default credentials.

Quality of Detection (QoD): 98%

Vulnerability Detection Result
```
It was possible to access the Apache ActiveMQ Web Console at:
http://activemq514.trabalho_vulnnet:8161/admin/index.jsp using user "admin" with
↪ password "admin"
http://activemq514.trabalho_vulnnet:8161/admin/index.jsp using user "user" with
↪password "user"
```

Impact
This issue may be exploited by a remote attacker to gain access to sensitive information.

Solution:
Solution type: Mitigation
Change or set the password.

Vulnerability Detection Method
Details: `Apache ActiveMQ Web Console Default / No Credentials (HTTP)`
OID:1.3.6.1.4.1.25623.1.0.108253
Version used: `2023-02-28T10:20:42Z`

References
`url: https://activemq.apache.org/web-console.html`

Critical (CVSS: 10.0)
NVT: Mort Bay / Eclipse Jetty End of Life (EOL) Detection - Linux

Product detection result
```
cpe:/a:eclipse:jetty:9.2.13.20150730
Detected by Mort Bay / Eclipse Jetty Detection (HTTP) (OID: 1.3.6.1.4.1.25623.1.
↪0.800953)
```

Summary
The Mort Bay / Eclipse Jetty version on the remote host has reached the End of Life (EOL) and should not be used anymore.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "Mort Bay / Eclipse Jetty" version on the remote host has reached the end of
↪ life.
CPE:                cpe:/a:eclipse:jetty:9.2.13.20150730
Installed version:  9.2.13.20150730
Location/URL:       8161/tcp
EOL version:        9.2
EOL date:           2018-12-31
```

Impact

An EOL version of Mort Bay / Eclipse Jetty is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:

Solution type: VendorFix

Update the Mort Bay / Eclipse Jetty version on the remote host to a still supported version.

Vulnerability Detection Method

Checks if an EOL version is present on the target host.

Details: `Mort Bay / Eclipse Jetty End of Life (EOL) Detection - Linux`

OID:1.3.6.1.4.1.25623.1.0.117294

Version used: `2025-04-15T05:54:49Z`

Product Detection Result

Product: `cpe:/a:eclipse:jetty:9.2.13.20150730`

Method: `Mort Bay / Eclipse Jetty Detection (HTTP)`

OID: 1.3.6.1.4.1.25623.1.0.800953)

Impact
This issue may be exploited by a remote attacker to e.g. gain access to sensitive information or modify system configuration.

Solution:
Solution type: Mitigation
Change the password as soon as possible.

Vulnerability Insight
As the VT 'HTTP Brute Force Logins With Default Credentials' (OID: 1.3.6.1.4.1.25623.1.0.108041) might run into a timeout the actual reporting of this vulnerability takes place in this VT instead.

Vulnerability Detection Method
Reports default credentials detected by the VT 'HTTP Brute Force Logins With Default Credentials' (OID: 1.3.6.1.4.1.25623.1.0.108041).
Details: `HTTP Brute Force Logins With Default Credentials Reporting`
OID:1.3.6.1.4.1.25623.1.0.103240
Version used: `2025-05-23T15:42:02Z`

NVT: Eclipse Jetty Server Fake Pipeline Request Security Bypass Vulnerability - Linux

Product detection result

```
cpe:/a:eclipse:jetty:9.2.13.20150730
Detected by Mort Bay / Eclipse Jetty Detection (HTTP) (OID: 1.3.6.1.4.1.25623.1.
↪0.800953)
```

Summary

Eclipse Jetty Server is prone to a security bypass vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 9.2.13.20150730
Fixed version:     9.2.25.v20180606
Installation
path / port:       8161/tcp
```

Impact

Successful exploitation will allow an attacker to bypass authorization.

Solution:

Solution type: VendorFix

Upgrade to Eclipse Jetty Server version 9.2.25.v20180606 or 9.3.24.v20180605 or 9.4.11.v20180605 or later as per the series. Please see the references for more information.

Affected Software/OS

Eclipse Jetty Server versions 9.2.x before 9.2.25.v20180606, 9.3.x before 9.3.24.v20180605 and 9.4.x before 9.4.11.v20180605.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
The flaw exists due to an improper validation against pipelined requests.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary
The PHP version on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "PHP" version on the remote host has reached the end of life.
CPE:               cpe:/a:php:php:5.5.9
Installed version: 5.5.9
EOL version:       5.5
EOL date:          2016-07-21
```

Impact
An EOL version of PHP is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: VendorFix
Update the PHP version on the remote host to a still supported version.

Vulnerability Insight
Each release branch of PHP is fully supported for two years from its initial stable release. During this period, bugs and security issues that have been reported are fixed and are released in regular point releases.
After this two year period of active support, each branch is then supported for an additional year for critical security issues only. Releases during this period are made on an as-needed basis: there may be multiple point releases, or none, depending on the number of reports.
Once the three years of support are completed, the branch reaches its end of life and is no longer supported.

Vulnerability Detection Method
Checks if an EOL version is present on the target host.
Details: `PHP End of Life (EOL) Detection - Linux`

```

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 2.4.7
Fixed version:     2.4.48
Installation
path / port:       80/tcp
```

Impact
- CVE-2020-35452: A specially crafted Digest nonce can cause a stack overflow in mod_auth_digest.
- CVE-2021-26690: A specially crafted Cookie header handled by mod_session can cause a NULL pointer dereference and crash, leading to a possible Denial Of Service.
- CVE-2021-26691: A specially crafted SessionHeader sent by an origin server could cause a heap overflow.

Solution:
Solution type: VendorFix
Update to version 2.4.48 or later.

Affected Software/OS
Apache HTTP Server versions 2.4.0 to 2.4.46 on Linux.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2020-35452: mod_auth_digest possible stack overflow by one null byte
- CVE-2021-26690: mod_session NULL pointer dereference
- CVE-2021-26691: mod_session response handling heap overflow

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 2.4.0 - 2.4.46 Multiple Vulnerabilities - Linux`

. . . continues on next page . . .

. . . continued from previous page . . .

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.26
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to cause a denial of service, to read or write to arbitrary files, also execute arbitrary code via a long reply to a LIST command, leading to a heap-based buffer overflow.

Solution:
Solution type: VendorFix
Update to version 5.4.42, 5.5.26, 5.6.10 or later.

Affected Software/OS
PHP prior to version 5.4.42, 5.5.x prior to 5.5.26 and 5.6.x prior to 5.6.10 on Linux.

Vulnerability Insight
The following flaws exist:
- Improper validation of token extraction for table names, in the php_pgsql_meta_data function in pgsql.c in the PostgreSQL extension.
- Integer overflow in the ftp_genlist function in ext/ftp/ftp.c
- PHP does not ensure that pathnames lack %00 sequences.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.4.42, 5.5.x < 5.5.26, 5.6.x < 5.6.10 Multiple Vulnerabilities (Aug 2016. ↪..`

NVT: PHP < 7.1.33, 7.2.x < 7.2.24, 7.3.x < 7.3.11 RCE Vulnerability - Version Check

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a remote code execution (RCE) vulnerability in certain nginx + php-fpm configurations.

Quality of Detection (QoD): 30%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     7.1.33
Installation
path / port:       80/tcp
```

Impact

Successful exploitation would allow an unauthenticated remote attacker to execute arbitrary code on the target machine.

Solution:

Solution type: VendorFix

Update to version 7.1.33, 7.2.24, 7.3.11 or later.

As an alternative a workaround to update the nginx configuration to mitigate this vulnerability is described at the PHP.net bugtracker linked in the references.

Affected Software/OS

PHP prior to version 7.1.33, 7.2.x prior to 7.2.24 and 7.3.x prior to 7.3.11.

Vulnerability Insight

The file sapi/fpm/fpm/fpm_main.c contains pointer arithmetic that assumes that env_path_info has a prefix equal to the path to the php script. However, the code does not check this assumption is satisfied. The absence of the check can lead to an invalid pointer in the 'path_info' variable.

Such conditions can be achieved in a pretty standard Nginx configuration. The regexp in 'fastcgi_split_path_info' directive can be broken using the newline character (in encoded form, %0a). Broken regexp leads to empty PATH_INFO, which triggers the bug.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `PHP < 7.1.33, 7.2.x < 7.2.24, 7.3.x < 7.3.11 RCE Vulnerability - Version Check`

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a remote code execution (RCE) or denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     7.0.12
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 7.0.12 or later.

Affected Software/OS

PHP versions prior to 7.0.12.

Vulnerability Insight

The SplObjectStorage unserialize implementation in ext/spl/spl_observer.c does not verify that a key is an object, which allows remote attackers to execute arbitrary code or cause a denial of service (uninitialized memory access) via crafted serialized data.

Vulnerability Detection Method

Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 5.5.9
Fixed version: 5.5.28
Installation
path / port: 80/tcp

Impact
Successfully exploiting this issue allow remote attackers to cause a denial of service (NULL pointer dereference and application crash) or trigger unintended method execution to defeat cryptographic protection mechanisms.

Solution:
Solution type: VendorFix

. . . continues on next page . . .

. . . continued from previous page . . .

Update to version 5.4.44, 5.5.28, 5.6.12 or later.

Affected Software/OS
PHP prior to version 5.4.44, 5.5.x prior to 5.5.28 and 5.6.x prior to 5.6.12 on Linux.

Vulnerability Insight
Multiple flaws exist due to:
- An improper validation of certain Exception objects in 'Zend/zend_exceptions.c' script.
- The 'openssl_random_pseudo_bytes' function in 'ext/openssl/openssl.c' incorrectly relies on the deprecated 'RAND_pseudo_bytes' function.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.34
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to cause a denial of service (buffer overflow and application crash) or possibly execute arbitrary code.

Solution:
Solution type: VendorFix
Update to version 5.5.34, 5.6.20, 7.0.5 or later.

Affected Software/OS
PHP prior to version 5.5.34, 5.6.x prior to 5.6.20 and 7.0.x prior to 7.0.5 on Linux.

Vulnerability Insight
The following flaws exist:
- Multiple integer overflows in the mbfl_strcut function in 'ext/mbstring/libmbfl/mbfl/mbfilter.c' script.
- Format string vulnerability in the php_snmp_error function in 'ext/snmp/snmp.c' script.
- An improper handling of '\0' characters by the 'phar_analyze_path' function in 'ext/phar/phar.c' script.
- An integer overflow in the 'php_raw_url_encode' function in 'ext/standard/url.c' script.
- An improper handling of continuation-level jumps in 'file_check_mem' function in 'funcs.c' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: PHP < 5.6.29, 7.0.x < 7.0.14 DoS Vulnerability - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

. . . continues on next page . . .

. . . continued from previous page . . .

Summary
PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.29
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 5.6.29, 7.0.14 or later.

Affected Software/OS
PHP versions prior to 5.6.29 and 7.0.x prior to 7.0.14.

Vulnerability Insight
The php_wddx_push_element function in ext/wddx/wddx.c allows remote attackers to cause a denial of service (out-of-bounds read and memory corruption) or possibly have unspecified other impact via an empty boolean element in a wddxPacket XML document.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.29, 7.0.x < 7.0.14 DoS Vulnerability - Linux`

Critical (CVSS: 9.8)
NVT: Apache HTTP Server Multiple Vulnerabilities (Jun 2017) - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.26
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow remote attackers to bypass authentication and perform unauthorized actions, cause a denial-of-service condition and gain access to potentially sensitive information.

Solution:

Solution type: VendorFix

Update to Apache HTTP Server 2.2.33 or 2.4.26 or later.

Affected Software/OS

Apache HTTP Server 2.2.x before 2.2.33 and 2.4.x before 2.4.26.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

Multiple flaws exist as,
- The mod_mime can read one byte past the end of a buffer when sending a malicious Content-Type response header.
- The mod_ssl may dereference a NULL pointer when third-party modules call ap_hook_process_connection() during an HTTP request to an HTTPS port.
- An use of the ap_get_basic_auth_pw() by third-party modules outside of the authentication phase may lead to authentication requirements being bypassed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Apache HTTP Server Multiple Vulnerabilities (Apr 2018) - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.30
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow an attacker to replay HTTP requests across servers without detection, influence the user content, upload a malicious file, crash the Apache HTTP Server and perform denial of service attack.

Solution:

Solution type: VendorFix

Update to version 2.4.30 or later. Please see the references for more information.

Affected Software/OS

Apache HTTP Server versions from 2.4.1 to 2.4.4, 2.4.6, 2.4.7, 2.4.9, 2.4.10, 2.4.12, 2.4.16 to 2.4.18, 2.4.20, 2.4.23, 2.4.25 to 2.4.29.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
Multiple flaws exist due to:
- Apache HTTP Server fails to correctly generate the nonce sent to prevent reply attacks.
- Misconfigured mod_session variable, HTTP_SESSION.
- Apache HTTP Server fails to sanitize the expression specified in '<FilesMatch>'.
- An error in Apache HTTP Server 'mod_authnz_ldap' when configured with AuthLDAPCharsetConfig.
- Apache HTTP Server fails to sanitize against a specially crafted request.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: PHP < 5.5.38, 5.6.x < 5.6.24, 7.0.x < 7.0.9 Multiple Vulnerabilities (Jul 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.38
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues may allow attackers to cause a denial of service obtain sensitive information from process memory, or possibly have unspecified other impact.

Solution:

Solution type: VendorFix

Update to version 5.5.38, 5.6.24, 7.0.9 or later.

Affected Software/OS

PHP prior to version 5.5.38, 5.6.x prior to 5.6.24 and 7.x prior to 7.0.9.

Vulnerability Insight

The following flaws exist:
- Integer overflow in the 'php_stream_zip_opener' function in 'ext/zip/zip_stream.c'
- Integer signedness error in the 'simplestring_addn' function in 'simplestring.c' in xmlrpc-epi
- 'ext/snmp/snmp.c' improperly interacts with the unserialize implementation and garbage collection
- The 'locale_accept_from_http' function in 'ext/intl/locale/locale_methods.c' does not properly restrict calls to the ICU 'uloc_acceptLanguageFromHTTP' function
- Error in the 'exif_process_user_comment' function of 'ext/exif/exif.c'
- Error in the 'exif_process_IFD_in_MAKERNOTE' function of 'ext/exif/exif.c'
- 'ext/session/session.c' does not properly maintain a certain hash data structure
- Integer overflow in the 'virtual_file_ex' function of 'TSRM/tsrm_virtual_cwd.c'

. . . continues on next page . . .

. . . continued from previous page . . .

- Error in the 'php_url_parse_ex' function of 'ext/standard/url.c'
- Integer overflow error within _gdContributionsAlloc()
- Inadequate error handling in bzread()

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `PHP < 5.5.38, 5.6.x < 5.6.24, 7.0.x < 7.0.9 Multiple Vulnerabilities (Jul 2016).`

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     8.1.31
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.1.31, 8.2.26, 8.3.14 or later.

Affected Software/OS
PHP versions prior to 8.1.31, 8.2.x prior to 8.2.26 and 8.3.x prior to 8.3.14.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2024-8929: Leak partial content of the heap through heap buffer over-read
- CVE-2024-8932: OOB access in ldap_escape
- CVE-2024-11233: Single byte overread with convert.quoted-printable-decode filter
- CVE-2024-11234: Configuring a proxy in a stream context might allow for CRLF injection in URIs
- CVE-2024-11236: Integer overflow in the firebird/dblib quoter causing OOB writes
- No CVE: Heap-Use-After-Free in sapi_read_post_data Processing in CLI SAPI Interface

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to cause a denial of service, or possibly have unspecified other impact.

Solution:

Solution type: VendorFix

Update to version 5.6.26, 7.0.11 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
PHP prior to version 5.6.26 and 7.x prior to 7.0.11 on Linux.

Vulnerability Insight
The following flaws exist:
- Use-after-free vulnerability in the 'wddx_stack_destroy' function in 'ext/wddx/wddx.c' script.
- Improper verification of a BIT field has the UNSIGNED_FLAG flag in 'ext/mysqlnd/mysqlnd_wireprotocol.c' script.
- The ZIP signature-verification feature does not ensure that the uncompressed_filesize field is large enough.
- The script 'ext/spl/spl_array.c' proceeds with SplArray unserialization without validating a return value and data type.
- The script 'ext/intl/msgformat/msgformat_format.c' does not properly restrict the locale length provided to the Locale class in the ICU library.
- An error in the php_wddx_push_element function in ext/wddx/wddx.c.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.26, 7.x < 7.0.11 Multiple Vulnerabilities (Sep 2016) - Linux`

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.28
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 5.6.28, 7.0.13 or later.

Affected Software/OS

PHP prior to version 5.6.28 and 7.x prior to 7.0.13.

Vulnerability Insight

The following flaws exist:

- CVE-2016-8670: Stack Buffer Overflow in GD dynamicGetbuf
- CVE-2016-9933, CVE-2016-9934: Multiple denial of service (DoS) vulnerabilities
- CVE-2016-10397: Security bypass vulnerability

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `PHP < 5.6.28, 7.x < 7.0.13 Multiple Vulnerabilities (Nov 2016) - Linux`

`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple denial of service (DoS) vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     None
Installation
path / port:       80/tcp
```

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
PHP versions through 7.1.5.

Vulnerability Insight
The following flaws exist:
- CVE-2017-8923: The zend_string_extend function in Zend/zend_string.h does not prevent changes to string objects that result in a negative length, which allows remote attackers to cause a denial of service (application crash) or possibly have unspecified other impact by leveraging a script's use of .= with a long string.
- CVE-2017-9119: The i_zval_ptr_dtor function in Zend/zend_variables.h allows attackers to cause a denial of service (memory consumption and application crash) or possibly have unspecified other impact by triggering crafted operations on array data structures.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: PHP < 5.6.31, 7.0.x < 7.0.21, 7.1.x < 7.1.7 Multiple Vulnerabilities (Jul 2017) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.31
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to leak information from the interpreter, crash PHP interpreter and also disclose sensitive information.

Solution:

Solution type: VendorFix

Update to version 5.6.31, 7.0.21, 7.1.7 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
PHP prior to version 5.6.31, 7.0.x prior to 7.0.21 and 7.1.x prior to 7.1.7.

Vulnerability Insight
The following vulnerabilities exist:
- An ext/date/lib/parse_date.c out-of-bounds read affecting the php_parse_date function.
- The openssl extension PEM sealing code did not check the return value of the OpenSSL sealing function.
- lack of bounds checks in the date extension's timelib_meridian parsing code.
- A stack-based buffer overflow in the zend_ini_do_op() function in the 'Zend/zend_ini_parser.c' script.
- The GIF decoding function gdImageCreateFromGifCtx in gd_gif_in.c in the GD Graphics Library (aka libgd) does not zero colorMap arrays before use.
- Heap buffer overread (READ: 1) finish_nested_data from unserialize
- oniguruma upstream fix

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.31, 7.0.x < 7.0.21, 7.1.x < 7.1.7 Multiple Vulnerabilities (Jul 2017).`

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a use-after-free vulnerability in a used third-pary library.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     7.1.32
Installation
path / port:       80/tcp
```

Impact

This flaw allows attackers to potentially cause information disclosure, denial of service, or possibly code execution by providing a crafted regular expression.

Solution:

Solution type: VendorFix

Update to version 7.1.32, 7.3.9 or later.

Affected Software/OS

PHP version before 7.1.32 and 7.3.x before 7.3.9.

Vulnerability Insight

The flaw exists due to a use-after-free in onig_new_deluxe() in regext.c of the third-party library Oniguruma 6.9.2 which is used by PHP.

The attacker provides a pair of a regex pattern and a string, with a multi-byte encoding that gets handled by onig_new_deluxe().

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 5.5.9
Fixed version: 5.5.37
Installation
path / port: 80/tcp

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

Successfully exploiting these issues allow remote attackers to cause a denial of service (buffer overflow and application crash) or possibly execute arbitrary code.

Solution:
Solution type: VendorFix
Update to PHP version 5.5.37, 5.6.23, 7.0.8 or later.

Affected Software/OS
PHP prior to version 5.5.37, 5.6.x prior to 5.6.23 and 7.x prior to 7.0.8 on Linux.

Vulnerability Insight
The following flaws exist:
- The 'php_zip.c' script in the zip extension improperly interacts with the unserialize implementation and garbage collection.
- The php_wddx_process_data function in 'wddx.c' script in the WDDX extension mishandled data in a wddx_deserialize call.
- The multiple integer overflows in 'mcrypt.c' script in the mcrypt extension.
- The double free vulnerability in the '_php_mb_regex_ereg_replace_exec' function in 'php_mbregex.c' script in the mbstring extension.
- An integer overflow in the '_gd2GetHeader' function in 'gd_gd2.c' script in the GD Graphics Library.
- An integer overflow in the 'gdImageCreate' function in 'gd.c' script in the GD Graphics Library.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.37, 5.6.x < 5.6.23, 7.x < 7.0.8 Multiple Vulnerabilities (Aug 2016) -. ↪..`

Critical (CVSS: 9.8)
NVT: PHP < 5.6.25, 7.x < 7.0.10 Multiple Vulnerabilities (Sep 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.25
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to cause a denial of service, to obtain sensitive information from process memory, to inject arbitrary-type session data by leveraging control of a session name.

Solution:

Solution type: VendorFix

Update to version 5.6.25, 7.0.10 or later.

Affected Software/OS

PHP prior to version 5.6.25 and 7.x prior to 7.0.10 on Linux.

Vulnerability Insight

The following flaws exist:

- Invalid wddxPacket XML document that is mishandled in a wddx_deserialize call in 'ext/wddx/wddx.c' script.
- Error in 'php_wddx_pop_element' function in 'ext/wddx/wddx.c' script.
- An error in 'php_wddx_process_data' function in 'ext/wddx/wddx.c' script.
- Improper handling of the case of a thumbnail offset that exceeds the file size in 'exif_process_IFD_in_TIFF' function in 'ext/exif/exif.c' script.
- Improper validation of gamma values in 'imagegammacorrect' function in 'ext/gd/gd.c' script.
- Improper validation of number of colors in 'imagegammacorrect' function in 'ext/gd/gd.c' script.

. . . continues on next page . . .

. . . continued from previous page . . .

- The script 'ext/session/session.c' skips invalid session names in a way that triggers incorrect parsing.
- Improper handling of certain objects in 'ext/standard/var_unserializer.c' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Product detection result
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)

Summary
Apache HTTP Server is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.52
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.52 or later.

Affected Software/OS
Apache HTTP Server versions through 2.4.51.

Vulnerability Insight
A carefully crafted request body can cause a buffer overflow in the mod_lua multipart parser (r:parsebody() called from Lua scripts).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.35
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to cause a denial of service (out-of-bounds read) or possibly have unspecified other impact.

Solution:

Solution type: VendorFix

Update to version 5.5.35, 5.6.21, 7.0.6 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
PHP prior to version 5.5.35, 5.6.x prior to 5.6.21 and 7.x prior to 7.0.6 on Linux.

Vulnerability Insight
The following flaws exist:
- Improper validation of TIFF start data in 'exif_process_TIFF_in_JPEG' function in 'ext/exif/exif.c' script.
- Improper validation of IFD sizes in 'exif_process_TIFF_in_JPEG' function in 'ext/exif/exif.c' script.
- Improper construction of spprintf arguments, in 'exif_process_TIFF_in_JPEG' function in 'ext/exif/exif.c' script.
- Error in 'grapheme_strpos function' in 'ext/intl/grapheme/grapheme_string.c'.
- Error in 'xml_parse_into_struct' function in 'ext/xml/xml.c' script.
- The 'bcpowmod' function in 'ext/bcmath/bcmath.c' improperly modifies certain data structures.
- Improper validation of input passed to 'bcpowmod' function in 'ext/bcmath/bcmath.c' script.
- Error in 'grapheme_strpos' function in ext/intl/grapheme/grapheme_string.c script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.35, 5.6.x < 5.6.21, 7.x < 7.0.6 Multiple Vulnerabilities (Jul 2016) -.`

NVT: PHP < 5.6.7 DoS Vulnerability - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.7
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to cause a denial of service.

Solution:

Solution type: VendorFix

Update to version 5.6.7 or later.

Affected Software/OS

PHP prior to version 5.6.7 on Linux.

Vulnerability Insight

The flaw is due to 'type confusion' issues in 'ext/soap/php_encoding.c', 'ext/soap/php_http.c', and 'ext/soap/soap.c' scripts.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `PHP < 5.6.7 DoS Vulnerability - Linux`

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to an arbitrary code execution vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.27
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to execute arbitrary code by triggering a failed SplMinHeap::compare operation.

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to version 5.5.27, 5.6.11 or later.

Affected Software/OS
PHP prior to version 5.5.27 and 5.6.x prior to 5.6.11 on Linux.

Vulnerability Insight
An use-after-free vulnerability occurs in the 'spl_ptr_heap_insert' function in 'ext/spl/spl_heap.c'.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.27, 5.6.x < 5.6.11 Arbitrary Code Execution Vulnerability (Aug 2016) .`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.33
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to gain access to potentially sensitive information and conduct a denial of service (memory corruption and application crash).

Solution:
Solution type: VendorFix
Update to PHP version 5.5.33, 5.6.19 or later.

Affected Software/OS
PHP prior to version 5.5.33 and 5.6.x prior to 5.6.19 on Linux.

Vulnerability Insight
The following flaws exist:
- Use-after-free error in wddx.c script in the WDDX extension in PHP
- Error in the phar_parse_zipfile function in zip.c script in the PHAR extension in PHP.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Solution:

Solution type: WillNotFix

No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS

PHP versions through 5.6.27 and 7.0.x through 7.0.12.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

PHP mishandles property modification during __wakeup processing, which allows remote attackers to cause a denial of service or possibly have unspecified other impact via crafted serialized data, as demonstrated by Exception::__toString with DateInterval::__wakeup.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP <= 5.6.27 / 7.0.x <= 7.0.12 DoS Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.117802
Version used: `2025-09-24T05:39:03Z`

Product Detection Result
Product: `cpe:/a:php:php:5.5.9`
Method: `PHP Detection Consolidation`
OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.37
Installation
path / port:       80/tcp
```

. . . continues on next page . . .

. . . continued from previous page . . .

Impact
Successfully exploiting these issues allow remote attackers to cause a denial of service (use-after-free and application crash) or possibly execute arbitrary code or possibly have unspecified other impact via a large integer argument.

Solution:
Solution type: VendorFix
Update to version 5.5.37, 5.6.23 or later.

Affected Software/OS
PHP prior to version 5.5.37 and 5.6.x prior to 5.6.23 on Linux.

Vulnerability Insight
The following flaws exist:
- The 'spl_array.c' in the SPL extension improperly interacts with the unserialize implementation and garbage collection.
- Integer overflow in the 'SplFileObject::fread' function in 'spl_directory.c' in the SPL extension.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.37, 5.6.x < 5.6.23 Multiple Vulnerabilities (Aug 2016) - Linux`

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.60
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 2.4.60 or later.

Affected Software/OS

Apache HTTP Server version 2.4.59 and prior.

Vulnerability Insight

The following flaws exist:

- CVE-2024-36387: Denial of Service (DoS) by Null pointer in websocket over HTTP/2
- CVE-2024-38473: Proxy encoding problem
- CVE-2024-38474: Weakness with encoded question marks in backreferences
- CVE-2024-38475: Weakness in mod_rewrite when first segment of substitution matches filesystem path
- CVE-2024-38476: May use exploitable/malicious backend application output to run local handlers via internal redirect
- CVE-2024-38477: Crash resulting in DoS in mod_proxy via a malicious request

. . . continues on next page . . .

. . . continued from previous page . . .

Product detection result
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 5.5.9

. . . continues on next page . . .

. . . continued from previous page . . .

```
Fixed version:     5.5.29
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to read arbitrary empty directories, also to cause a denial of service.

Solution:
Solution type: VendorFix
Update to version 5.4.45, 5.5.29, 5.6.13 or later.

Affected Software/OS
PHP prior to version 5.4.45, 5.5.x prior to 5.5.29 and 5.6.x prior to 5.6.13 on Linux.

Vulnerability Insight
The following flaws exist:
- Error in the 'ZipArchive::extractTo' function in 'ext/zip/php_zip.c' script.
- The xsl_ext_function_php function in ext/xsl/xsltprocessor.c when libxml2 is used, does not consider the possibility of a NULL valuePop return value before proceeding with a free operation after the principal argument loop.
- Improper handling of multiple php_var_unserialize calls
- Multiple use-after-free vulnerabilities

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.4.45, 5.5.x < 5.5.29, 5.6.x < 5.6.13 Multiple Vulnerabilities (Jul 2016. ↪..`

Critical (CVSS: 9.8)
NVT: Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a HTTP request smuggling vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.56
Installation
path / port:       80/tcp
```

Impact

Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

Solution:

Solution type: VendorFix

Update to version 2.4.56 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
Apache HTTP Server versions 2.4.0 through 2.4.55.

Vulnerability Insight
Some mod_proxy configurations allow a HTTP Request Smuggling attack.
Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux`

NVT: PHP 5.x < 5.6.34, 7.x < 7.0.28, 7.1.x < 7.1.15, 7.2.x < 7.2.3 Stack Buffer Overflow Vulnerability (Mar 2018) - Linux

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to a stack buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.34
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow an attacker to execute arbitrary code in the context of the affected application. Failed exploit attempts will result in denial-of-service conditions.

Solution:
Solution type: VendorFix
Update to version 5.6.34, 7.0.28, 7.1.15, 7.2.3 or later.

Affected Software/OS
PHP versions 5.x prior to 5.6.34, 7.x prior to 7.0.28, 7.1.x prior to 7.1.15 and 7.2.x prior to 7.2.3 on Linux.

Vulnerability Insight
The flaw exists because php fails to adequately bounds-check user-supplied data before copying it into an insufficiently sized buffer.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP 5.x < 5.6.34, 7.x < 7.0.28, 7.1.x < 7.1.15, 7.2.x < 7.2.3 Stack Buffer Over.`

NVT: PHP < 8.1.32, 8.2.x < 8.2.28 Multiple Vulnerabilities - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     8.1.32
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 8.1.32, 8.2.28 or later.

Affected Software/OS

PHP versions prior to 8.1.32, and 8.2.x prior to 8.2.28.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2025-1217: Header parser of 'http' stream wrapper does not handle folded headers
- CVE-2025-1219: libxml streams use wrong 'content-type' header when requesting a redirected resource
- CVE-2025-1734: Streams HTTP wrapper does not fail for headers without colon
- CVE-2025-1736: Stream HTTP wrapper header check might omit basic auth header
- CVE-2025-1861: Stream HTTP wrapper truncate redirect location to 1024 bytes

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.26
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting this issue allow remote attackers to cause a denial of service.

Solution:
Solution type: VendorFix
Update to version 5.6.26 or later.

Affected Software/OS
PHP prior to version 5.6.26 on Linux.

Vulnerability Insight
The flaw is due to improper handling of object-deserialization failures in 'ext/standard/var_unserializer.re' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: PHP < 5.6.26 DoS Vulnerability - Linux

. . . continued from previous page . . .

Summary
PHP is prone to an XML external entity (XXE) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.22
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting this issue allow remote attackers to conduct XML External Entity (XXE) and XML Entity Expansion (XEE) attacks.

Solution:
Solution type: VendorFix
Update to PHP version 5.5.22, 5.6.6 or later.

Affected Software/OS
PHP prior to version 5.5.22 and 5.6.x prior to 5.6.6 on Linux.

Vulnerability Insight
The flaw is due to script 'ext/libxml/libxml.c' does not isolate each thread from 'libxml_disable_entity_loader' when PHP-FPM is used.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.22, 5.6.x < 5.6.6 XXE Vulnerability - Linux`

Critical (CVSS: 9.1)
NVT: PHP < 5.5.31, 5.6.x < 5.6.17, 7.x < 7.0.2 Out of Bounds Read Memory Corruption Vulnerability (Mar 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to an out-of-bounds read memory corruption vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.31
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to obtain sensitive information or cause a denial-of-service condition.

Solution:

Solution type: VendorFix

Update to version 5.5.31, 5.6.17, 7.0.2 or later.

Affected Software/OS

PHP prior to version 5.5.31, 5.6.x prior to 5.6.17 and 7.x prior to 7.0.2 on Linux.

Vulnerability Insight

A memory corruption vulnerability occurs via a large 'bgd_color' argument to the 'imagerotate' function in 'ext/gd/libgd/gd_interpolation.c' script.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.31, 5.6.x < 5.6.17, 7.x < 7.0.2 Out of Bounds Read Memory Corruption . ↪..`

NVT: Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux

Product detection result
`cpe:/a:apache:http_server:2.4.7`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.27
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow remote attackers to cause the target service to crash. A remote user can obtain potentially sensitive information as well on the target system.

Solution:
Solution type: VendorFix
Update to Apache HTTP Server 2.2.34 or 2.4.27 or later.

Affected Software/OS
Apache HTTP Server 2.2.x before 2.2.34 and 2.4.x before 2.4.27.

Vulnerability Insight
The flaw exists due to error in Apache 'mod_auth_digest' which does not properly initialize memory used to process 'Digest' type HTTP Authorization headers.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux`

Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

. . . continues on next page . . .

. . . continued from previous page . . .

Summary
PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.31
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting this issue allow attackers to obtain sensitive information from process memory or cause a denial of service (out-of-bounds read and buffer overflow) via a long string.

Solution:
Solution type: VendorFix
Update to version 5.5.31, 5.6.17, 7.0.2 or later.

Affected Software/OS
PHP prior to version 5.5.31, 5.6.x prior to 5.6.17 and 7.x prior to 7.0.2 on Linux.

Vulnerability Insight
The flaw is due to the 'sapi/fpm/fpm/fpm_log.c' script misinterprets the semantics of the snprintf return value.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Product detection result

```
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.55
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 2.4.55 or later.

Affected Software/OS

Apache HTTP Server version 2.4.54 and prior.

Vulnerability Insight

The following vulnerabilities exist:

- CVE-2006-20001: mod_dav out of bounds read, or write of zero byte
- CVE-2022-36760: Possible request smuggling in mod_proxy_ajp
- CVE-2022-37436: mod_proxy allows a backend to trigger HTTP response splitting

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Installation
path / port:       3306/tcp
```

Impact

Successful exploitation will allow remote attackers to have an impact on confidentiality, integrity and availability.

Solution:

Solution type: VendorFix

The vendor has released updates. Please see the references for more information.

Affected Software/OS

Oracle MySQL version 5.5.x through 5.5.61, 5.6.x through 5.6.41, 5.7.x through 5.7.23 and 8.0.x through 8.0.12.

Vulnerability Insight

Multiple flaws exist due to:

. . . continues on next page . . .

. . . continued from previous page . . .

- An unspecified error within 'InnoDB (zlib)' component of MySQL Server.
- An unspecified error within 'Server: Parser' component of MySQL Server.
- An unspecified error within 'Client programs' component of MySQL Server.
- An unspecified error within 'Server: Storage Engines' component of MySQL Server.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Oracle Mysql Security Update (cpuoct2018 - 02) - Linux`
OID:1.3.6.1.4.1.25623.1.0.814259
Version used: `2025-09-09T05:38:49Z`

Product Detection Result
Product: `cpe:/a:mysql:mysql:5.5.47-`
Method: `MariaDB / Oracle MySQL Detection (MySQL Protocol)`
OID: 1.3.6.1.4.1.25623.1.0.100152)

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
Fixed version:     8.1.30
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.1.30, 8.2.24, 8.3.12 or later.

Affected Software/OS
PHP versions prior to 8.1.30, 8.2.x prior to 8.2.24 and 8.3.x prior to 8.3.12.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2024-8925, CVE-2024-8928: Erroneous parsing of multipart form data
- CVE-2024-8926: Bypass of CVE-2024-4577, Parameter Injection Vulnerability
- CVE-2024-8927: cgi.force_redirect configuration is bypassable due to the environment variable collision
- CVE-2024-9026: Logs from children may be altered

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 8.1.30, 8.2.x < 8.2.24, 8.3.x < 8.3.12 Multiple Vulnerabilities - Linux`

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.36
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow an attacker to conduct XSS attacks, crash PHP, conduct denial of service condition and execute arbitrary code in the context of the affected application.

Solution:

Solution type: VendorFix

Update to version 5.6.36, 7.0.30, 7.1.17, 7.2.5 or later.

Affected Software/OS

PHP prior to version 5.6.36, 7.0.x prior to 7.0.30, 7.1.x prior to 7.1.17 and 7.2.x prior to 7.2.5 on Linux.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
The following flaws exist:
- CVE-2018-10549: Out of bounds read error in 'exif_read_data' function while processing crafted JPG data.
- CVE-2018-10546: An error in stream filter 'convert.iconv' which leads to infinite loop on invalid sequence.
- CVE-2018-10548: An error in the LDAP module of PHP which allows a malicious LDAP server or man-in-the-middle attacker to crash PHP.
- CVE-2018-10547: An error in the 'phar_do_404()' function in 'ext/phar/phar_object.c' script which returns parts of the request unfiltered, leading to another XSS vector. This is due to incomplete fix for CVE-2018-5712.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.36, 7.x < 7.0.30, 7.1.x < 7.1.17, 7.2.x < 7.2.5 Multiple Vulnerabilit.`

. . . continued from previous page . . .

cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.18
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting this issue allow remote attackers to cause a denial of service (heap memory corruption) or possibly have unspecified other impact.

Solution:
Solution type: VendorFix
Update to version 5.6.18, 7.0.3 or later.

Affected Software/OS
PHP prior to version 5.6.18 and 7.x prior to 7.0.3 on Linux.

Vulnerability Insight
The flaw is due an improper handling of zero-size '././@LongLink' files by 'phar_make_dirstream' function in ext/phar/dirstream.c script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: PHP < 5.6.18, 7.x < 7.0.3 DoS Vulnerability (Jul 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP released new versions which include a security fix.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     7.4.30
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 7.4.30, 8.0.20, 8.1.7 or later.

Affected Software/OS

PHP prior to version 7.4.30, 8.0.x through 8.0.19 and 8.1.x through 8.1.6.

Vulnerability Insight

The following vulnerabilities exist:
- CVE-2022-31625: Uninitialized array in pg_query_params()
- CVE-2022-31626: mysqlnd/pdo password buffer overflow

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Critical (CVSS: 10.0)
NVT: PHP End of Life (EOL) Detection - Linux

Product detection result

```
cpe:/a:php:php:7.1.32
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

The PHP version on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "PHP" version on the remote host has reached the end of life.
CPE:                cpe:/a:php:php:7.1.32
Installed version: 7.1.32
EOL version:        7.1
EOL date:           2019-12-01
```

Impact

An EOL version of PHP is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:

Solution type: VendorFix

Update the PHP version on the remote host to a still supported version.

Vulnerability Insight

Each release branch of PHP is fully supported for two years from its initial stable release. During this period, bugs and security issues that have been reported are fixed and are released in regular point releases.

After this two year period of active support, each branch is then supported for an additional year for critical security issues only. Releases during this period are made on an as-needed basis: there may be multiple point releases, or none, depending on the number of reports.

Once the three years of support are completed, the branch reaches its end of life and is no longer supported.

NVT: Apache HTTP Server 2.4.0 - 2.4.46 Multiple Vulnerabilities - Linux

Product detection result
`cpe:/a:apache:http_server:2.4.38`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 2.4.38
Fixed version:     2.4.48
Installation
path / port:       80/tcp
```

Impact
- CVE-2020-35452: A specially crafted Digest nonce can cause a stack overflow in mod_auth_digest.
- CVE-2021-26690: A specially crafted Cookie header handled by mod_session can cause a NULL pointer dereference and crash, leading to a possible Denial Of Service.
- CVE-2021-26691: A specially crafted SessionHeader sent by an origin server could cause a heap overflow.

Solution:
Solution type: VendorFix
Update to version 2.4.48 or later.

Affected Software/OS
Apache HTTP Server versions 2.4.0 to 2.4.46 on Linux.

. . . continues on next page . . .

NVT: PHP < 7.1.33, 7.2.x < 7.2.24, 7.3.x < 7.3.11 RCE Vulnerability - Version Check

Product detection result

```
cpe:/a:php:php:7.1.32
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a remote code execution (RCE) vulnerability in certain nginx + php-fpm configurations.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.1.32
Fixed version:     7.1.33
Installation
path / port:       80/tcp
```

Impact

Successful exploitation would allow an unauthenticated remote attacker to execute arbitrary code on the target machine.

Solution:

Solution type: VendorFix

Update to version 7.1.33, 7.2.24, 7.3.11 or later.

As an alternative a workaround to update the nginx configuration to mitigate this vulnerability is described at the PHP.net bugtracker linked in the references.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
PHP prior to version 7.1.33, 7.2.x prior to 7.2.24 and 7.3.x prior to 7.3.11.

Vulnerability Insight
The file sapi/fpm/fpm/fpm_main.c contains pointer arithmetic that assumes that env_path_info has a prefix equal to the path to the php script. However, the code does not check this assumption is satisfied. The absence of the check can lead to an invalid pointer in the 'path_info' variable.
Such conditions can be achieved in a pretty standard Nginx configuration. The regexp in 'fastcgi_split_path_info' directive can be broken using the newline character (in encoded form, %0a). Broken regexp leads to empty PATH_INFO, which triggers the bug.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.38
Fixed version:     2.4.60
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 2.4.60 or later.

Affected Software/OS

Apache HTTP Server version 2.4.59 and prior.

Vulnerability Insight

The following flaws exist:

- CVE-2024-36387: Denial of Service (DoS) by Null pointer in websocket over HTTP/2
- CVE-2024-38473: Proxy encoding problem
- CVE-2024-38474: Weakness with encoded question marks in backreferences
- CVE-2024-38475: Weakness in mod_rewrite when first segment of substitution matches filesystem path
- CVE-2024-38476: May use exploitable/malicious backend application output to run local handlers via internal redirect
- CVE-2024-38477: Crash resulting in DoS in mod_proxy via a malicious request
- CVE-2024-39573: mod_rewrite proxy handler substitution

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: PHP < 8.1.29, 8.2.x < 8.2.20, 8.3.x < 8.3.8 Multiple Vulnerabilities - Linux

Product detection result

```
cpe:/a:php:php:7.1.32
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.1.32
Fixed version:     8.1.29
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 8.1.29, 8.2.20, 8.3.8 or later.

Affected Software/OS

PHP prior to version 8.1.29, version 8.2.x through 8.2.19 and 8.3.x through 8.3.7.

Vulnerability Insight

The following vulnerabilities exist:
- CVE-2024-4577: Argument injection in PHP-CGI (bypass of CVE-2012-1823)
- CVE-2024-5458: Filter bypass in filter_var FILTER_VALIDATE_URL
- CVE-2024-5585: Bypass of CVE-2024-1874

Note: As of 06/2024 the CVEs CVE-2024-4577 and CVE-2024-5585 are known to be exploitable on Windows systems only.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

NVT: Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux

Product detection result
cpe:/a:apache:http_server:2.4.38
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

Apache HTTP Server is prone to a HTTP request smuggling vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.38
Fixed version:     2.4.56
Installation
path / port:       80/tcp
```

Impact

Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

Solution:

Solution type: VendorFix

Update to version 2.4.56 or later.

Affected Software/OS

Apache HTTP Server versions 2.4.0 through 2.4.55.

Vulnerability Insight

Some mod_proxy configurations allow a HTTP Request Smuggling attack.

Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux`

Critical (CVSS: 9.8)
NVT: PHP < 8.1.32, 8.2.x < 8.2.28 Multiple Vulnerabilities - Linux

Product detection result

```
cpe:/a:php:php:7.1.32
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.1.32
Fixed version:     8.1.32
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 8.1.32, 8.2.28 or later.

Affected Software/OS

PHP versions prior to 8.1.32, and 8.2.x prior to 8.2.28.

Vulnerability Insight

The following vulnerabilities exist:

. . . continues on next page . . .

. . . continued from previous page . . .

- CVE-2025-1217: Header parser of 'http' stream wrapper does not handle folded headers
- CVE-2025-1219: libxml streams use wrong 'content-type' header when requesting a redirected resource
- CVE-2025-1734: Streams HTTP wrapper does not fail for headers without colon
- CVE-2025-1736: Stream HTTP wrapper header check might omit basic auth header
- CVE-2025-1861: Stream HTTP wrapper truncate redirect location to 1024 bytes

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 8.1.32, 8.2.x < 8.2.28 Multiple Vulnerabilities - Linux`

NVT: Apache HTTP Server Memory Access Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.38
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a memory access vulnerability.

Quality of Detection (QoD): 30%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Installed version: 2.4.38
Fixed version:     2.4.41
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.41 or later.

Affected Software/OS
Apache HTTP Server version 2.4.18 to 2.4.39.

Vulnerability Insight
Using fuzzed network input, the http/2 session handling could be made to read memory after being freed during connection shutdown.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server Memory Access Vulnerability - Linux`

2.3.2 Critical general/tcp

Critical (CVSS: 10.0)
NVT: Operating System (OS) End of Life (EOL) Detection

Product detection result
cpe:/o:debian:debian_linux:10
Detected by OS Detection Consolidation and Reporting (OID: 1.3.6.1.4.1.25623.1.0
↪.105937)

Summary
The Operating System (OS) on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
The "Debian GNU/Linux" Operating System on the remote host has reached the end o
↪f life.
CPE: cpe:/o:debian:debian_linux:10
Installed version,
build or SP: 10
EOL date: 2024-06-30
EOL info: https://en.wikipedia.org/wiki/List_of_Debian_releases#Release
↪_table

Impact
An EOL version of an OS is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: Mitigation
Update the OS on the remote host to a version which is still supported and receiving security updates by the vendor.
Note / Important: Please create an override for this result if the target host is a:
- Windows system with Extended Security Updates (ESU)
- System with additional 3rd-party / non-vendor security updates like e.g. from 'TuxCare', 'Freexian Extended LTS' or similar

Vulnerability Detection Method
Checks if an EOL version of an OS is present on the target host.
Details: Operating System (OS) End of Life (EOL) Detection
OID:1.3.6.1.4.1.25623.1.0.103674

Product detection result
`cpe:/a:php:php:7.1.32`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.1.32
Fixed version:     8.1.30
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.1.30, 8.2.24, 8.3.12 or later.

Affected Software/OS
PHP versions prior to 8.1.30, 8.2.x prior to 8.2.24 and 8.3.x prior to 8.3.12.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2024-8925, CVE-2024-8928: Erroneous parsing of multipart form data
- CVE-2024-8926: Bypass of CVE-2024-4577, Parameter Injection Vulnerability
- CVE-2024-8927: cgi.force_redirect configuration is bypassable due to the environment variable collision
- CVE-2024-9026: Logs from children may be altered

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 8.1.30, 8.2.x < 8.2.24, 8.3.x < 8.3.12 Multiple Vulnerabilities - Linux`

High (CVSS: 8.2)
NVT: Apache HTTP Server 2.4.7 - 2.4.51 Multiple Vulnerabilities - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.38
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.38
Fixed version:     2.4.52
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 2.4.52 or later.

Affected Software/OS

Apache HTTP Server version 2.4.7 through 2.4.51.

Vulnerability Insight

A crafted URI sent to httpd configured as a forward proxy (ProxyRequests on) can cause a crash (NULL pointer dereference) or, for configurations mixing forward and reverse proxy declarations, can allow for requests to be directed to a declared Unix Domain Socket endpoint (Server Side Request Forgery).

Vulnerability Detection Result

```
Installed version: 7.1.32
Fixed version:     8.2.30
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.2.30, 8.3.29, 8.4.16 or later.

Affected Software/OS
PHP versions prior to 8.2.30, 8.3.x prior to 8.3.29 and 8.4.x prior to 8.4.16.

Vulnerability Insight
The following flaws exist:
- CVE-2025-14177: Information leak of memory in getimagesize
- CVE-2025-14178: Heap buffer overflow in array_merge()
- CVE-2025-14180: PDO quoting result null deref
- No CVE: Null byte termination in dns_get_record()

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.48
Installation
path / port:       80/tcp
```

Impact
- CVE-2020-35452: A specially crafted Digest nonce can cause a stack overflow in mod_auth_digest.
- CVE-2021-26690: A specially crafted Cookie header handled by mod_session can cause a NULL pointer dereference and crash, leading to a possible Denial Of Service.
- CVE-2021-26691: A specially crafted SessionHeader sent by an origin server could cause a heap overflow.

Solution:
Solution type: VendorFix
Update to version 2.4.48 or later.

Affected Software/OS
Apache HTTP Server versions 2.4.0 to 2.4.46 on Linux.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2020-35452: mod_auth_digest possible stack overflow by one null byte
- CVE-2021-26690: mod_session NULL pointer dereference
- CVE-2021-26691: mod_session response handling heap overflow

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.26
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow remote attackers to bypass authentication and perform unauthorized actions, cause a denial-of-service condition and gain access to potentially sensitive information.

Solution:

Solution type: VendorFix

Update to Apache HTTP Server 2.2.33 or 2.4.26 or later.

Affected Software/OS

Apache HTTP Server 2.2.x before 2.2.33 and 2.4.x before 2.4.26.

Vulnerability Insight

Multiple flaws exist as,

- The mod_mime can read one byte past the end of a buffer when sending a malicious Content-Type response header.

- The mod_ssl may dereference a NULL pointer when third-party modules call ap_hook_process_connection() during an HTTP request to an HTTPS port.

- An use of the ap_get_basic_auth_pw() by third-party modules outside of the authentication phase may lead to authentication requirements being bypassed.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.54
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.54 or later.

Affected Software/OS
Apache HTTP Server version 2.4.53 and prior.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2022-26377: mod_proxy_ajp: Possible request smuggling
- CVE-2022-28614: Read beyond bounds via ap_rwrite()
- CVE-2022-28615: Read beyond bounds in ap_strcmp_match()
- CVE-2022-29404: Denial of service in mod_lua r:parsebody
- CVE-2022-30556: Information disclosure in mod_lua with websockets
- CVE-2022-31813: mod_proxy X-Forwarded-For dropped by hop-by-hop mechanism

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server < 2.4.54 Multiple Vulnerabilities - Linux`

NVT: Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.52
Installation
path / port:       80/tcp
```

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to version 2.4.52 or later.

Affected Software/OS
Apache HTTP Server versions through 2.4.51.

Vulnerability Insight
A carefully crafted request body can cause a buffer overflow in the mod_lua multipart parser (r:parsebody() called from Lua scripts).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux`

NVT: Apache HTTP Server Multiple Vulnerabilities (Apr 2018) - Linux

Product detection result
`cpe:/a:apache:http_server:2.4.25`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.30
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow an attacker to replay HTTP requests across servers without detection, influence the user content, upload a malicious file, crash the Apache HTTP Server and perform denial of service attack.

Solution:
Solution type: VendorFix
Update to version 2.4.30 or later. Please see the references for more information.

Affected Software/OS
Apache HTTP Server versions from 2.4.1 to 2.4.4, 2.4.6, 2.4.7, 2.4.9, 2.4.10, 2.4.12, 2.4.16 to 2.4.18, 2.4.20, 2.4.23, 2.4.25 to 2.4.29.

Vulnerability Insight
Multiple flaws exist due to:
- Apache HTTP Server fails to correctly generate the nonce sent to prevent reply attacks.
- Misconfigured mod_session variable, HTTP_SESSION.
- Apache HTTP Server fails to sanitize the expression specified in '<FilesMatch>'.
- An error in Apache HTTP Server 'mod_authnz_ldap' when configured with AuthLDAPCharsetConfig.
- Apache HTTP Server fails to sanitize against a specially crafted request.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server Multiple Vulnerabilities (Apr 2018) - Linux`

NVT: Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux

Product detection result
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)

Summary
Apache HTTP Server is prone to a HTTP request smuggling vulnerability.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.56
Installation
path / port:       80/tcp
```

Impact

Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

Solution:

Solution type: VendorFix

Update to version 2.4.56 or later.

Affected Software/OS

Apache HTTP Server versions 2.4.0 through 2.4.55.

Vulnerability Insight

Some mod_proxy configurations allow a HTTP Request Smuggling attack.
Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux`

OID:1.3.6.1.4.1.25623.1.0.104597

NVT: Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.27
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow remote attackers to cause the target service to crash. A remote user can obtain potentially sensitive information as well on the target system.

Solution:

Solution type: VendorFix

Update to Apache HTTP Server 2.2.34 or 2.4.27 or later.

Affected Software/OS

. . . continues on next page . . .

. . . continued from previous page . . .

Apache HTTP Server 2.2.x before 2.2.34 and 2.4.x before 2.4.27.

Vulnerability Insight
The flaw exists due to error in Apache 'mod_auth_digest' which does not properly initialize memory used to process 'Digest' type HTTP Authorization headers.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux`

Detected by OS Detection Consolidation and Reporting (OID: 1.3.6.1.4.1.25623.1.0
↪.105937)
```

Summary

The Operating System (OS) on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The "Debian GNU/Linux" Operating System on the remote host has reached the end o
↪f life.
CPE:                cpe:/o:debian:debian_linux:9
Installed version,
build or SP:        9
EOL date:           2022-06-30
EOL info:           https://en.wikipedia.org/wiki/List_of_Debian_releases#Release
↪_table
```

Impact

An EOL version of an OS is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:

Solution type: Mitigation

Update the OS on the remote host to a version which is still supported and receiving security updates by the vendor.

Note / Important: Please create an override for this result if the target host is a:
- Windows system with Extended Security Updates (ESU)
- System with additional 3rd-party / non-vendor security updates like e.g. from 'TuxCare', 'Freexian Extended LTS' or similar

Vulnerability Detection Method

Checks if an EOL version of an OS is present on the target host.

Summary

The PHP version on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "PHP" version on the remote host has reached the end of life.
CPE:               cpe:/a:php:php:5.5.9
Installed version: 5.5.9
EOL version:       5.5
EOL date:          2016-07-21
```

Impact

An EOL version of PHP is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:

Solution type: VendorFix

Update the PHP version on the remote host to a still supported version.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
Each release branch of PHP is fully supported for two years from its initial stable release. During this period, bugs and security issues that have been reported are fixed and are released in regular point releases.
After this two year period of active support, each branch is then supported for an additional year for critical security issues only. Releases during this period are made on an as-needed basis: there may be multiple point releases, or none, depending on the number of reports.
Once the three years of support are completed, the branch reaches its end of life and is no longer supported.

Vulnerability Detection Method
Checks if an EOL version is present on the target host.
Details: `PHP End of Life (EOL) Detection - Linux`
OID:1.3.6.1.4.1.25623.1.0.105889

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 5.5.9
Fixed version:     5.5.29
Installation
path / port:       80/tcp
```

. . . continues on next page . . .

. . . continued from previous page . . .

Impact
Successfully exploiting these issues allow remote attackers to read arbitrary empty directories, also to cause a denial of service.

Solution:
Solution type: VendorFix
Update to version 5.4.45, 5.5.29, 5.6.13 or later.

Affected Software/OS
PHP prior to version 5.4.45, 5.5.x prior to 5.5.29 and 5.6.x prior to 5.6.13 on Linux.

Vulnerability Insight
The following flaws exist:
- Error in the 'ZipArchive::extractTo' function in 'ext/zip/php_zip.c' script.
- The xsl_ext_function_php function in ext/xsl/xsltprocessor.c when libxml2 is used, does not consider the possibility of a NULL valuePop return value before proceeding with a free operation after the principal argument loop.
- Improper handling of multiple php_var_unserialize calls
- Multiple use-after-free vulnerabilities

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.4.45, 5.5.x < 5.5.29, 5.6.x < 5.6.13 Multiple Vulnerabilities (Jul 2016. ↪..`

```

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

Successfully exploiting these issues allow remote attackers to cause a denial of service (buffer overflow and application crash) or possibly execute arbitrary code.

Solution:
Solution type: VendorFix
Update to version 5.5.34, 5.6.20, 7.0.5 or later.

Affected Software/OS
PHP prior to version 5.5.34, 5.6.x prior to 5.6.20 and 7.0.x prior to 7.0.5 on Linux.

Vulnerability Insight
The following flaws exist:
- Multiple integer overflows in the mbfl_strcut function in 'ext/mbstring/libmbfl/mbfl/mbfilter.c' script.
- Format string vulnerability in the php_snmp_error function in 'ext/snmp/snmp.c' script.
- An improper handling of '\0' characters by the 'phar_analyze_path' function in 'ext/phar/phar.c' script.
- An integer overflow in the 'php_raw_url_encode' function in 'ext/standard/url.c' script.
- An improper handling of continuation-level jumps in 'file_check_mem' function in 'funcs.c' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: Apache HTTP Server Multiple Vulnerabilities (Apr 2018) - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.30
Installation
path / port:       80/tcp
```

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

Successful exploitation will allow an attacker to replay HTTP requests across servers without detection, influence the user content, upload a malicious file, crash the Apache HTTP Server and perform denial of service attack.

Solution:
Solution type: VendorFix
Update to version 2.4.30 or later. Please see the references for more information.

Affected Software/OS
Apache HTTP Server versions from 2.4.1 to 2.4.4, 2.4.6, 2.4.7, 2.4.9, 2.4.10, 2.4.12, 2.4.16 to 2.4.18, 2.4.20, 2.4.23, 2.4.25 to 2.4.29.

Vulnerability Insight
Multiple flaws exist due to:
- Apache HTTP Server fails to correctly generate the nonce sent to prevent reply attacks.
- Misconfigured mod_session variable, HTTP_SESSION.
- Apache HTTP Server fails to sanitize the expression specified in '<FilesMatch>'.
- An error in Apache HTTP Server 'mod_authnz_ldap' when configured with AuthLDAPCharsetConfig.
- Apache HTTP Server fails to sanitize against a specially crafted request.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server Multiple Vulnerabilities (Apr 2018) - Linux`

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to a stack buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.34
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow an attacker to execute arbitrary code in the context of the affected application. Failed exploit attempts will result in denial-of-service conditions.

Solution:
Solution type: VendorFix
Update to version 5.6.34, 7.0.28, 7.1.15, 7.2.3 or later.

Affected Software/OS
PHP versions 5.x prior to 5.6.34, 7.x prior to 7.0.28, 7.1.x prior to 7.1.15 and 7.2.x prior to 7.2.3 on Linux.

Vulnerability Insight
The flaw exists because php fails to adequately bounds-check user-supplied data before copying it into an insufficiently sized buffer.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP 5.x < 5.6.34, 7.x < 7.0.28, 7.1.x < 7.1.15, 7.2.x < 7.2.3 Stack Buffer Over.`

NVT: PHP < 5.4.43, 5.5.x < 5.5.27, 5.6.x < 5.6.11 Multiple Vulnerabilities (Mar 2016) - Linux

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

. . . continues on next page . . .

. . . continued from previous page . . .

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 5.5.9
Fixed version:     5.5.27
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to execute arbitrary code in the context of the PHP process. Failed exploit attempts will likely crash the webserver.

Solution:
Solution type: VendorFix
Update to version 5.4.43, 5.5.27, 5.6.11 or later.

Affected Software/OS
PHP prior to version 5.4.43, 5.5.x prior to 5.5.27 and 5.6.x prior to 5.6.11 on Linux.

Vulnerability Insight
The following flaws exist:
- Inadequate boundary checks on user-supplied input by 'phar_fix_filepath' function in 'ext/phar/phar.c' script.
- Improper validation of file pointer in the 'phar_convert_to_other' function in 'ext/phar/phar_object.c' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.4.43, 5.5.x < 5.5.27, 5.6.x < 5.6.11 Multiple Vulnerabilities (Mar 2016. ↪..`

NVT: Apache HTTP Server Multiple Vulnerabilities (Jun 2017) - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.26
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow remote attackers to bypass authentication and perform unauthorized actions, cause a denial-of-service condition and gain access to potentially sensitive information.

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to Apache HTTP Server 2.2.33 or 2.4.26 or later.

Affected Software/OS
Apache HTTP Server 2.2.x before 2.2.33 and 2.4.x before 2.4.26.

Vulnerability Insight
Multiple flaws exist as,
- The mod_mime can read one byte past the end of a buffer when sending a malicious Content-Type response header.
- The mod_ssl may dereference a NULL pointer when third-party modules call ap_hook_process_connection() during an HTTP request to an HTTPS port.
- An use of the ap_get_basic_auth_pw() by third-party modules outside of the authentication phase may lead to authentication requirements being bypassed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.38
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues may allow attackers to cause a denial of service obtain sensitive information from process memory, or possibly have unspecified other impact.

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to version 5.5.38, 5.6.24, 7.0.9 or later.

Affected Software/OS
PHP prior to version 5.5.38, 5.6.x prior to 5.6.24 and 7.x prior to 7.0.9.

Vulnerability Insight
The following flaws exist:
- Integer overflow in the 'php_stream_zip_opener' function in 'ext/zip/zip_stream.c'
- Integer signedness error in the 'simplestring_addn' function in 'simplestring.c' in xmlrpc-epi
- 'ext/snmp/snmp.c' improperly interacts with the unserialize implementation and garbage collection
- The 'locale_accept_from_http' function in 'ext/intl/locale/locale_methods.c' does not properly restrict calls to the ICU 'uloc_acceptLanguageFromHTTP' function
- Error in the 'exif_process_user_comment' function of 'ext/exif/exif.c'
- Error in the 'exif_process_IFD_in_MAKERNOTE' function of 'ext/exif/exif.c'
- 'ext/session/session.c' does not properly maintain a certain hash data structure
- Integer overflow in the 'virtual_file_ex' function of 'TSRM/tsrm_virtual_cwd.c'
- Error in the 'php_url_parse_ex' function of 'ext/standard/url.c'
- Integer overflow error within _gdContributionsAlloc()
- Inadequate error handling in bzread()

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: Apache HTTP Server < 2.4.60 Multiple Vulnerabilities - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.60
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 2.4.60 or later.

Affected Software/OS

Apache HTTP Server version 2.4.59 and prior.

Vulnerability Insight

The following flaws exist:

. . . continues on next page . . .

. . . continued from previous page . . .

- CVE-2024-36387: Denial of Service (DoS) by Null pointer in websocket over HTTP/2
- CVE-2024-38473: Proxy encoding problem
- CVE-2024-38474: Weakness with encoded question marks in backreferences
- CVE-2024-38475: Weakness in mod_rewrite when first segment of substitution matches filesystem path
- CVE-2024-38476: May use exploitable/malicious backend application output to run local handlers via internal redirect
- CVE-2024-38477: Crash resulting in DoS in mod_proxy via a malicious request
- CVE-2024-39573: mod_rewrite proxy handler substitution

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server < 2.4.60 Multiple Vulnerabilities - Linux`
OID:1.3.6.1.4.1.25623.1.0.114682
Version used: `2025-08-07T05:44:51Z`

Critical (CVSS: 9.8)
NVT: PHP < 5.6.31, 7.0.x < 7.0.21, 7.1.x < 7.1.7 Multiple Vulnerabilities (Jul 2017) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.31
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to leak information from the interpreter, crash PHP interpreter and also disclose sensitive information.

Solution:

Solution type: VendorFix

Update to version 5.6.31, 7.0.21, 7.1.7 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
PHP prior to version 5.6.31, 7.0.x prior to 7.0.21 and 7.1.x prior to 7.1.7.

Vulnerability Insight
The following vulnerabilities exist:
- An ext/date/lib/parse_date.c out-of-bounds read affecting the php_parse_date function.
- The openssl extension PEM sealing code did not check the return value of the OpenSSL sealing function.
- lack of bounds checks in the date extension's timelib_meridian parsing code.
- A stack-based buffer overflow in the zend_ini_do_op() function in the 'Zend/zend_ini_parser.c' script.
- The GIF decoding function gdImageCreateFromGifCtx in gd_gif_in.c in the GD Graphics Library (aka libgd) does not zero colorMap arrays before use.
- Heap buffer overread (READ: 1) finish_nested_data from unserialize
- oniguruma upstream fix

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.31, 7.0.x < 7.0.21, 7.1.x < 7.1.7 Multiple Vulnerabilities (Jul 2017).`

Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

. . . continues on next page . . .

. . . continued from previous page . . .

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 5.5.9
Fixed version:     5.5.28
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting this issue allow remote attackers to cause a denial of service (NULL pointer dereference and application crash) or trigger unintended method execution to defeat cryptographic protection mechanisms.

Solution:
Solution type: VendorFix
Update to version 5.4.44, 5.5.28, 5.6.12 or later.

Affected Software/OS
PHP prior to version 5.4.44, 5.5.x prior to 5.5.28 and 5.6.x prior to 5.6.12 on Linux.

Vulnerability Insight
Multiple flaws exist due to:
- An improper validation of certain Exception objects in 'Zend/zend_exceptions.c' script.
- The 'openssl_random_pseudo_bytes' function in 'ext/openssl/openssl.c' incorrectly relies on the deprecated 'RAND_pseudo_bytes' function.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.4.44, 5.5.x < 5.5.28, 5.6.x < 5.6.12 Multiple Vulnerabilities (Jul 2016. ↪..`

cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

. . . continues on next page . . .

. . . continued from previous page . . .

```
Installed version: 5.5.9
Fixed version:     5.5.37
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to cause a denial of service (buffer overflow and application crash) or possibly execute arbitrary code.

Solution:
Solution type: VendorFix
Update to PHP version 5.5.37, 5.6.23, 7.0.8 or later.

Affected Software/OS
PHP prior to version 5.5.37, 5.6.x prior to 5.6.23 and 7.x prior to 7.0.8 on Linux.

Vulnerability Insight
The following flaws exist:
- The 'php_zip.c' script in the zip extension improperly interacts with the unserialize implementation and garbage collection.
- The php_wddx_process_data function in 'wddx.c' script in the WDDX extension mishandled data in a wddx_deserialize call.
- The multiple integer overflows in 'mcrypt.c' script in the mcrypt extension.
- The double free vulnerability in the '_php_mb_regex_ereg_replace_exec' function in 'php_mbregex.c' script in the mbstring extension.
- An integer overflow in the '_gd2GetHeader' function in 'gd_gd2.c' script in the GD Graphics Library.
- An integer overflow in the 'gdImageCreate' function in 'gd.c' script in the GD Graphics Library.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     8.1.31
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 8.1.31, 8.2.26, 8.3.14 or later.

Affected Software/OS

PHP versions prior to 8.1.31, 8.2.x prior to 8.2.26 and 8.3.x prior to 8.3.14.

Vulnerability Insight

The following vulnerabilities exist:
- CVE-2024-8929: Leak partial content of the heap through heap buffer over-read
- CVE-2024-8932: OOB access in ldap_escape
- CVE-2024-11233: Single byte overread with convert.quoted-printable-decode filter
- CVE-2024-11234: Configuring a proxy in a stream context might allow for CRLF injection in URIs
- CVE-2024-11236: Integer overflow in the firebird/dblib quoter causing OOB writes
- No CVE: Heap-Use-After-Free in sapi_read_post_data Processing in CLI SAPI Interface

Critical (CVSS: 9.8)
NVT: PHP < 5.6.26, 7.x < 7.0.11 Multiple Vulnerabilities (Sep 2016) - Linux

Product detection result
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

. . . continues on next page . . .

. . . continued from previous page . . .

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.26
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting this issue allow remote attackers to cause a denial of service, or possibly have unspecified other impact.

Solution:
Solution type: VendorFix
Update to version 5.6.26, 7.0.11 or later.

Affected Software/OS
PHP prior to version 5.6.26 and 7.x prior to 7.0.11 on Linux.

Vulnerability Insight
The following flaws exist:
- Use-after-free vulnerability in the 'wddx_stack_destroy' function in 'ext/wddx/wddx.c' script.
- Improper verification of a BIT field has the UNSIGNED_FLAG flag in 'ext/mysqlnd/mysqlnd_wireprotocol.c' script.
- The ZIP signature-verification feature does not ensure that the uncompressed_filesize field is large enough.
- The script 'ext/spl/spl_array.c' proceeds with SplArray unserialization without validating a return value and data type.
- The script 'ext/intl/msgformat/msgformat_format.c' does not properly restrict the locale length provided to the Locale class in the ICU library.
- An error in the php_wddx_push_element function in ext/wddx/wddx.c.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Impact
Successfully exploiting this issue allow remote attackers to cause a denial of service.

Solution:
Solution type: VendorFix
Update to version 5.6.26 or later.

Affected Software/OS
PHP prior to version 5.6.26 on Linux.

Vulnerability Insight
The flaw is due to improper handling of object-deserialization failures in 'ext/standard/var_unserializer.re' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.26 DoS Vulnerability - Linux`

`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     None
Installation
path / port:       80/tcp
```

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
PHP versions through 5.6.27 and 7.0.x through 7.0.12.

Vulnerability Insight
PHP mishandles property modification during __wakeup processing, which allows remote attackers to cause a denial of service or possibly have unspecified other impact via crafted serialized data, as demonstrated by Exception::__toString with DateInterval::__wakeup.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP <= 5.6.27 / 7.0.x <= 7.0.12 DoS Vulnerability`

Critical (CVSS: 9.8)
NVT: PHP < 7.1.33, 7.2.x < 7.2.24, 7.3.x < 7.3.11 RCE Vulnerability - Version Check

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a remote code execution (RCE) vulnerability in certain nginx + php-fpm configurations.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     7.1.33
Installation
path / port:       80/tcp
```

Impact

Successful exploitation would allow an unauthenticated remote attacker to execute arbitrary code on the target machine.

Solution:

Solution type: VendorFix

Update to version 7.1.33, 7.2.24, 7.3.11 or later.

As an alternative a workaround to update the nginx configuration to mitigate this vulnerability is described at the PHP.net bugtracker linked in the references.

Affected Software/OS

PHP prior to version 7.1.33, 7.2.x prior to 7.2.24 and 7.3.x prior to 7.3.11.

Vulnerability Insight

The file sapi/fpm/fpm/fpm_main.c contains pointer arithmetic that assumes that env_path_info has a prefix equal to the path to the php script. However, the code does not check this assumption is satisfied. The absence of the check can lead to an invalid pointer in the 'path_info' variable.

. . . continues on next page . . .

. . . continued from previous page . . .

Such conditions can be achieved in a pretty standard Nginx configuration. The regexp in 'fastcgi_split_path_info' directive can be broken using the newline character (in encoded form, %0a). Broken regexp leads to empty PATH_INFO, which triggers the bug.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: PHP < 5.5.27, 5.6.x < 5.6.11 Arbitrary Code Execution Vulnerability (Aug 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to an arbitrary code execution vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.27
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to execute arbitrary code by triggering a failed SplMinHeap::compare operation.

Solution:

Solution type: VendorFix

Update to version 5.5.27, 5.6.11 or later.

Affected Software/OS

PHP prior to version 5.5.27 and 5.6.x prior to 5.6.11 on Linux.

Vulnerability Insight

An use-after-free vulnerability occurs in the 'spl_ptr_heap_insert' function in 'ext/spl/spl_heap.c'.

. . . continues on next page . . .

. . . continued from previous page . . .

. . . continued from previous page . . .

path / port: 80/tcp

Impact
Successfully exploiting these issues allow remote attackers to cause a denial of service, to obtain sensitive information from process memory and to execute arbitrary code via crafted dimensions.

Solution:
Solution type: VendorFix
Update to version 5.4.40, 5.5.24, 5.6.8 or later.

Affected Software/OS
PHP prior to version 5.4.40, 5.5.x prior to 5.5.24 and 5.6.x prior to 5.6.8.

Vulnerability Insight
The following flaws exist:
- Multiple stack-based buffer overflows in the 'phar_set_inode' function in phar_internal.h script in PHP.
- Vulnerabilities in 'phar_parse_metadata' and 'phar_parse_pharfile' functions in ext/phar/phar.c script in PHP.
- A NULL pointer dereference flaw in the 'build_tablename' function in 'ext/pgsql/pgsql.c' script that is triggered when handling NULL return values for 'token'

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: PHP < 5.4.40, 5.5.x < 5.5.24, 5.6.x < 5.6.8 Multiple Vulnerabilities - Linux

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.35
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to cause a denial of service (out-of-bounds read) or possibly have unspecified other impact.

Solution:

Solution type: VendorFix

Update to version 5.5.35, 5.6.21, 7.0.6 or later.

Affected Software/OS

PHP prior to version 5.5.35, 5.6.x prior to 5.6.21 and 7.x prior to 7.0.6 on Linux.

Vulnerability Insight

The following flaws exist:

- Improper validation of TIFF start data in 'exif_process_TIFF_in_JPEG' function in 'ext/exif/exif.c' script.

. . . continues on next page . . .

. . . continued from previous page . . .

- Improper validation of IFD sizes in 'exif_process_TIFF_in_JPEG' function in 'ext/exif/exif.c' script.
- Improper construction of spprintf arguments, in 'exif_process_TIFF_in_JPEG' function in 'ext/exif/exif.c' script.
- Error in 'grapheme_strpos function' in 'ext/intl/grapheme/grapheme_string.c'.
- Error in 'xml_parse_into_struct' function in 'ext/xml/xml.c' script.
- The 'bcpowmod' function in 'ext/bcmath/bcmath.c' improperly modifies certain data structures.
- Improper validation of input passed to 'bcpowmod' function in 'ext/bcmath/bcmath.c' script.
- Error in 'grapheme_strpos' function in ext/intl/grapheme/grapheme_string.c script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Product detection result
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.48
Installation
path / port:       80/tcp
```

Impact

- CVE-2020-35452: A specially crafted Digest nonce can cause a stack overflow in mod_auth_digest.
- CVE-2021-26690: A specially crafted Cookie header handled by mod_session can cause a NULL pointer dereference and crash, leading to a possible Denial Of Service.
- CVE-2021-26691: A specially crafted SessionHeader sent by an origin server could cause a heap overflow.

Solution:

Solution type: VendorFix

Update to version 2.4.48 or later.

Affected Software/OS

Apache HTTP Server versions 2.4.0 to 2.4.46 on Linux.

Vulnerability Insight

The following vulnerabilities exist:

- CVE-2020-35452: mod_auth_digest possible stack overflow by one null byte
- CVE-2021-26690: mod_session NULL pointer dereference
- CVE-2021-26691: mod_session response handling heap overflow

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Product detection result

cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary

PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.7
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to cause a denial of service.

Solution:

Solution type: VendorFix

Update to version 5.6.7 or later.

Affected Software/OS

PHP prior to version 5.6.7 on Linux.

Vulnerability Insight

The flaw is due to 'type confusion' issues in 'ext/soap/php_encoding.c', 'ext/soap/php_http.c', and 'ext/soap/soap.c' scripts.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

NVT: PHP < 5.4.42, 5.5.x < 5.5.26, 5.6.x < 5.6.10 Multiple Vulnerabilities (Aug 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.26
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to cause a denial of service, to read or write to arbitrary files, also execute arbitrary code via a long reply to a LIST command, leading to a heap-based buffer overflow.

Solution:

Solution type: VendorFix

Update to version 5.4.42, 5.5.26, 5.6.10 or later.

Affected Software/OS

PHP prior to version 5.4.42, 5.5.x prior to 5.5.26 and 5.6.x prior to 5.6.10 on Linux.

Vulnerability Insight

The following flaws exist:

- Improper validation of token extraction for table names, in the php_pgsql_meta_data function in pgsql.c in the PostgreSQL extension.
- Integer overflow in the ftp_genlist function in ext/ftp/ftp.c
- PHP does not ensure that pathnames lack %00 sequences.

Vulnerability Detection Method

. . . continues on next page . . .

. . . continued from previous page . . .

Checks if a vulnerable version is present on the target host.
Details: PHP < 5.4.42, 5.5.x < 5.5.26, 5.6.x < 5.6.10 Multiple Vulnerabilities (Aug 2016.

NVT: PHP < 7.0.12 RCE / DoS Vulnerability - Linux

Product detection result

. . . continues on next page . . .

. . . continued from previous page . . .

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary
PHP is prone to a remote code execution (RCE) or denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     7.0.12
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 7.0.12 or later.

Affected Software/OS
PHP versions prior to 7.0.12.

Vulnerability Insight
The SplObjectStorage unserialize implementation in ext/spl/spl_observer.c does not verify that a key is an object, which allows remote attackers to execute arbitrary code or cause a denial of service (uninitialized memory access) via crafted serialized data.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 7.0.12 RCE / DoS Vulnerability - Linux`

Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.37
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to cause a denial of service (use-after-free and application crash) or possibly execute arbitrary code or possibly have unspecified other impact via a large integer argument.

Solution:

. . . continues on next page . . .

. . . continued from previous page . . .

Solution type: VendorFix
Update to version 5.5.37, 5.6.23 or later.

Affected Software/OS
PHP prior to version 5.5.37 and 5.6.x prior to 5.6.23 on Linux.

Vulnerability Insight
The following flaws exist:
- The 'spl_array.c' in the SPL extension improperly interacts with the unserialize implementation and garbage collection.
- Integer overflow in the 'SplFileObject::fread' function in 'spl_directory.c' in the SPL extension.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: PHP <= 7.1.5 Multiple DoS Vulnerabilities

Product detection result
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to multiple denial of service (DoS) vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     None
Installation
path / port:       80/tcp
```

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
PHP versions through 7.1.5.

Vulnerability Insight
The following flaws exist:
- CVE-2017-8923: The zend_string_extend function in Zend/zend_string.h does not prevent changes to string objects that result in a negative length, which allows remote attackers to cause a denial of service (application crash) or possibly have unspecified other impact by leveraging a script's use of .= with a long string.
- CVE-2017-9119: The i_zval_ptr_dtor function in Zend/zend_variables.h allows attackers to cause a denial of service (memory consumption and application crash) or possibly have unspecified other impact by triggering crafted operations on array data structures.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.52
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.52 or later.

Affected Software/OS
Apache HTTP Server versions through 2.4.51.

Vulnerability Insight
A carefully crafted request body can cause a buffer overflow in the mod_lua multipart parser (r:parsebody() called from Lua scripts).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux`

Critical (CVSS: 9.8)
NVT: PHP 'CVE-2019-13224' Use-After-Free Vulnerability - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a use-after-free vulnerability in a used third-pary library.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     7.1.32
Installation
path / port:       80/tcp
```

Impact

This flaw allows attackers to potentially cause information disclosure, denial of service, or possibly code execution by providing a crafted regular expression.

Solution:

Solution type: VendorFix

Update to version 7.1.32, 7.3.9 or later.

Affected Software/OS

PHP version before 7.1.32 and 7.3.x before 7.3.9.

Vulnerability Insight

The flaw exists due to a use-after-free in onig_new_deluxe() in regext.c of the third-party library Oniguruma 6.9.2 which is used by PHP.

The attacker provides a pair of a regex pattern and a string, with a multi-byte encoding that gets handled by onig_new_deluxe().

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

. . . continues on next page . . .

Product detection result
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 5.5.9
Fixed version: 8.1.29
Installation
path / port: 80/tcp

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to version 8.1.29, 8.2.20, 8.3.8 or later.

Affected Software/OS
PHP prior to version 8.1.29, version 8.2.x through 8.2.19 and 8.3.x through 8.3.7.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2024-4577: Argument injection in PHP-CGI (bypass of CVE-2012-1823)
- CVE-2024-5458: Filter bypass in filter_var FILTER_VALIDATE_URL
- CVE-2024-5585: Bypass of CVE-2024-1874
Note: As of 06/2024 the CVEs CVE-2024-4577 and CVE-2024-5585 are known to be exploitable on Windows systems only.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a HTTP request smuggling vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.56
Installation
path / port:       80/tcp
```

Impact

Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

Solution:

Solution type: VendorFix

Update to version 2.4.56 or later.

Affected Software/OS

Apache HTTP Server versions 2.4.0 through 2.4.55.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
Some mod_proxy configurations allow a HTTP Request Smuggling attack.
Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.25
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to cause a denial of service, to obtain sensitive information from process memory, to inject arbitrary-type session data by leveraging control of a session name.

Solution:

Solution type: VendorFix

Update to version 5.6.25, 7.0.10 or later.

Affected Software/OS

PHP prior to version 5.6.25 and 7.x prior to 7.0.10 on Linux.

Vulnerability Insight

The following flaws exist:

. . . continues on next page . . .

. . . continued from previous page . . .

- Invalid wddxPacket XML document that is mishandled in a wddx_deserialize call in 'ext/wddx/wddx.c' script.
- Error in 'php_wddx_pop_element' function in 'ext/wddx/wddx.c' script.
- An error in 'php_wddx_process_data' function in 'ext/wddx/wddx.c' script.
- Improper handling of the case of a thumbnail offset that exceeds the file size in 'exif_process_IFD_in_TIFF' function in 'ext/exif/exif.c' script.
- Improper validation of gamma values in 'imagegammacorrect' function in 'ext/gd/gd.c' script.
- Improper validation of number of colors in 'imagegammacorrect' function in 'ext/gd/gd.c' script.
- The script 'ext/session/session.c' skips invalid session names in a way that triggers incorrect parsing.
- Improper handling of certain objects in 'ext/standard/var_unserializer.c' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.6)
NVT: PHP < 5.5.22, 5.6.x < 5.6.6 XXE Vulnerability - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to an XML external entity (XXE) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.22
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to conduct XML External Entity (XXE) and XML Entity Expansion (XEE) attacks.

Solution:

Solution type: VendorFix

Update to PHP version 5.5.22, 5.6.6 or later.

Affected Software/OS

PHP prior to version 5.5.22 and 5.6.x prior to 5.6.6 on Linux.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

The flaw is due to script 'ext/libxml/libxml.c' does not isolate each thread from 'libxml_disable_entity_loader' when PHP-FPM is used.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.22, 5.6.x < 5.6.6 XXE Vulnerability - Linux`
OID:1.3.6.1.4.1.25623.1.0.808615

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

. . . continues on next page . . .

. . . continued from previous page . . .

```
Installed version: 5.5.9
Fixed version:     7.2.27
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 7.2.27, 7.3.14, 7.4.2 or later.

Affected Software/OS
PHP versions before 7.2.27, 7.3.x and 7.4.x.

Vulnerability Insight
PHP is prone to multiple vulnerabilities:
- OOB read in php_strip_tags_ex (CVE-2020-7059)
- Global buffer-overflow in 'mbfl_filt_conv_big5_wchar' (CVE-2020-7060)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 7.2.27, 7.3.x < 7.3.14, 7.4.x < 7.4.2 Multiple Vulnerabilities (Jan 2020).`

NVT: PHP < 5.5.31, 5.6.x < 5.6.17, 7.x < 7.0.2 Out of Bounds Read Memory Corruption Vulnerability (Mar 2016) - Linux

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to an out-of-bounds read memory corruption vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.31
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting this issue allow remote attackers to obtain sensitive information or cause a denial-of-service condition.

Solution:
Solution type: VendorFix
Update to version 5.5.31, 5.6.17, 7.0.2 or later.

Affected Software/OS
PHP prior to version 5.5.31, 5.6.x prior to 5.6.17 and 7.x prior to 7.0.2 on Linux.

Vulnerability Insight
A memory corruption vulnerability occurs via a large 'bgd_color' argument to the 'imagerotate' function in 'ext/gd/libgd/gd_interpolation.c' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.31, 5.6.x < 5.6.17, 7.x < 7.0.2 Out of Bounds Read Memory Corruption . ↪..`

Product detection result
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 5.5.9
Fixed version: 5.5.31
Installation
path / port: 80/tcp

Impact
Successfully exploiting this issue allow attackers to obtain sensitive information from process memory or cause a denial of service (out-of-bounds read and buffer overflow) via a long string.

Solution:

. . . continues on next page . . .

. . . continued from previous page . . .

Solution type: VendorFix
Update to version 5.5.31, 5.6.17, 7.0.2 or later.

Affected Software/OS
PHP prior to version 5.5.31, 5.6.x prior to 5.6.17 and 7.x prior to 7.0.2 on Linux.

Vulnerability Insight
The flaw is due to the 'sapi/fpm/fpm/fpm_log.c' script misinterprets the semantics of the snprintf return value.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.31, 5.6.x < 5.6.17, 7.x < 7.0.2 DoS Vulnerability (Aug 2016) - Linux`

NVT: Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux

Product detection result
`cpe:/a:apache:http_server:2.4.7`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

. . . continues on next page . . .

. . . continued from previous page . . .

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 2.4.7
Fixed version:     2.4.27
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow remote attackers to cause the target service to crash. A remote user can obtain potentially sensitive information as well on the target system.

Solution:
Solution type: VendorFix
Update to Apache HTTP Server 2.2.34 or 2.4.27 or later.

Affected Software/OS
Apache HTTP Server 2.2.x before 2.2.34 and 2.4.x before 2.4.27.

Vulnerability Insight
The flaw exists due to error in Apache 'mod_auth_digest' which does not properly initialize memory used to process 'Digest' type HTTP Authorization headers.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux`

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.36
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow an attacker to conduct XSS attacks, crash PHP, conduct denial of service condition and execute arbitrary code in the context of the affected application.

Solution:
Solution type: VendorFix
Update to version 5.6.36, 7.0.30, 7.1.17, 7.2.5 or later.

Affected Software/OS
PHP prior to version 5.6.36, 7.0.x prior to 7.0.30, 7.1.x prior to 7.1.17 and 7.2.x prior to 7.2.5 on Linux.

Vulnerability Insight
The following flaws exist:
- CVE-2018-10549: Out of bounds read error in 'exif_read_data' function while processing crafted JPG data.
- CVE-2018-10546: An error in stream filter 'convert.iconv' which leads to infinite loop on invalid sequence.
- CVE-2018-10548: An error in the LDAP module of PHP which allows a malicious LDAP server or man-in-the-middle attacker to crash PHP.
- CVE-2018-10547: An error in the 'phar_do_404()' function in 'ext/phar/phar_object.c' script which returns parts of the request unfiltered, leading to another XSS vector. This is due to incomplete fix for CVE-2018-5712.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.36, 7.x < 7.0.30, 7.1.x < 7.1.17, 7.2.x < 7.2.5 Multiple Vulnerabilit.`

NVT: PHP < 5.6.18, 7.x < 7.0.3 DoS Vulnerability (Jul 2016) - Linux

Product detection result
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 5.5.9
Fixed version: 5.6.18
Installation
path / port: 80/tcp

Impact
Successfully exploiting this issue allow remote attackers to cause a denial of service (heap memory corruption) or possibly have unspecified other impact.

Solution:

. . . continues on next page . . .

. . . continued from previous page . . .

Solution type: VendorFix
Update to version 5.6.18, 7.0.3 or later.

Affected Software/OS
PHP prior to version 5.6.18 and 7.x prior to 7.0.3 on Linux.

Vulnerability Insight
The flaw is due an improper handling of zero-size '././@LongLink' files by 'phar_make_dirstream' function in ext/phar/dirstream.c script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.18, 7.x < 7.0.3 DoS Vulnerability (Jul 2016) - Linux`

```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
Fixed version:     2.4.52
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.52 or later.

Affected Software/OS
Apache HTTP Server version 2.4.7 through 2.4.51.

Vulnerability Insight
A crafted URI sent to httpd configured as a forward proxy (ProxyRequests on) can cause a crash (NULL pointer dereference) or, for configurations mixing forward and reverse proxy declarations, can allow for requests to be directed to a declared Unix Domain Socket endpoint (Server Side Request Forgery).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Samba Command Injection Vulnerability (CVE-2025-10230)

Product detection result

```
cpe:/a:samba:samba:4.5.9
Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)
```

Summary

Samba is prone to a command injection vulnerability via WINS server hook script.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

. . . continues on next page . . .

. . . continued from previous page . . .

```
Installed version: 4.5.9
Fixed version:     4.21.9
Installation
path / port:       445/tcp
```

Solution:
Solution type: VendorFix
Update to version 4.21.9, 4.22.5, 4.23.2 or later.

Affected Software/OS
Samba version 4.x prior to 4.21.9, 4.22.x prior to 4.22.5 and 4.23.x prior to 4.23.2.

Vulnerability Insight
If a Samba server has WINS support enabled (it is off by default), and it has a 'wins hook' parameter specified, the program specified by that parameter will be run whenever a WINS name is changed.
The WINS server used by the Samba Active Directory Domain Controller did not validate the names passed to the wins hook program, and it passed them by inserting them into a string run by a shell.
WINS is an obsolete and trusting protocol, and clients can request any name that fits within the 15 character NetBIOS limit. This includes some shell metacharacters, making it possible to run arbitrary commands on the host.
The WINS server used by Samba when it is not a domain controller is unaffected.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Samba Command Injection Vulnerability (CVE-2025-10230)`

Installed version:  4.5.9
Location/URL:       445/tcp
EOL version:        4.5
EOL date:           2018-03-13
```

Impact

An EOL version of Samba is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:

Solution type: VendorFix

Update the Samba version on the remote host to a still supported version.

Vulnerability Detection Method

Checks if an EOL version is present on the target host.

Details: `Samba End of Life (EOL) Detection`

OID:1.3.6.1.4.1.25623.1.0.140159

Version used: `2025-04-15T05:54:49Z`

Product Detection Result

Product: `cpe:/a:samba:samba:4.5.9`

Method: `SMB NativeLanMan`

OID: 1.3.6.1.4.1.25623.1.0.102011)

Critical (CVSS: 9.8)
NVT: Samba RCE Vulnerability (SambaCry)

Product detection result
`cpe:/a:samba:samba:4.5.9`
`Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)`

Summary
Samba is prone to a remote code execution (RCE) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 4.5.9
Fixed version:     4.5.10 or apply patch
Installation
path / port:       445/tcp
```

Impact
Successfully exploiting this issue will allow remote attackers to execute arbitrary code as root on an affected system.

Solution:
Solution type: VendorFix
Upgrade to Samba 4.6.4 or 4.5.10 or 4.4.14 or later.

Affected Software/OS
All Samba Server versions 3.5.0 onwards,
Samba Server versions 4.4.x before 4.4.14,
Samba Server versions 4.5.x before 4.5.10, and
Samba Server versions 4.6.x before 4.6.4

Vulnerability Insight
The flaw exists due to an input validation error, which allows a malicious client to upload a shared library to a writable share.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Samba RCE Vulnerability (SambaCry)`
OID:1.3.6.1.4.1.25623.1.0.811055

Product detection result
cpe:/a:samba:samba:4.5.9
Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)

Summary
Samba is prone to a use-after-free vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 4.5.9
Fixed version: 4.5.15
Installation
path / port: 445/tcp

Impact
A malicious SMB1 request can be used to control the contents of heap memory via a deallocated heap pointer. It is possible this may be used to compromise the SMB server.

Solution:
Solution type: VendorFix
Update to Samba 4.5.15, 4.6.11, 4.7.3 or later. Workaround:

. . . continues on next page . . .

. . . continued from previous page . . .

Prevent SMB1 access to the server by setting the parameter:
server min protocol = SMB2
to the [global] section of your smb.conf and restart smbd. This prevents a SMB1 access to the server. Note this could cause older clients to be unable to connect to the server.

Affected Software/OS
Samba versions 4.0.0 to 4.5.14, 4.6.x prior to 4.6.11, 4.7.x prior to 4.7.3 with enabled SMBv1 support.

Vulnerability Insight
The flaw exists due to a client which may use an SMB1 request to manipulate the contents of heap space.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Samba Server 'CVE-2017-14746' Use-after-free Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.108294
Version used: `2025-09-17T05:39:26Z`

Product Detection Result
Product: `cpe:/a:samba:samba:4.5.9`

NVT: Samba Elevation of Privilege Vulnerability (CVE-2022-45141)

Product detection result
`cpe:/a:samba:samba:4.5.9`
`Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)`

. . . continues on next page . . .

. . . continued from previous page . . .

Summary
Samba is prone to an elevation of privilege vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 4.5.9
Fixed version:     4.15.13 / 4.16.0
Installation
path / port:       445/tcp
```

Solution:
Solution type: VendorFix
Update to version 4.15.13, 4.16.0 or later.

Affected Software/OS
Samba versions prior to 4.15.13.

Vulnerability Insight
Kerberos, the trusted third party authentication system at the heart of Active Directory, issues a ticket using a key known to the target server but nobody else, returned to the client in a TGS-REP.
This key needs to be of a type understood only by the KDC and target server.
However, due to a coding error subsequently addressed in all recent Heimdal versions and so fixed with Samba 4.16 (which imports Heimdal 8.0pre), the (attacking) client would be given the opportunity to select the encryption type, and so obtain a ticket encrypted with rc4-hmac, that it could attack offline.
This is possible unless rc4-hmac is totally removed from the server's account, by removing the unicodePwd attribute, but this will break other aspects of the server's operation in the domain (NETLOGON in particular).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Samba Elevation of Privilege Vulnerability (CVE-2022-45141)`

```
cpe:/a:samba:samba:4.5.9
Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)
```

Summary

Samba is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 4.5.9
Fixed version:     4.13.14
Installation
path / port:       445/tcp
```

Solution:

Solution type: VendorFix

Update to version 4.13.14, 4.14.10, 4.15.2 or later.

Affected Software/OS

Samba version 4.x through 4.13.13, 4.14.x through 4.14.9 and 4.15.x through 4.15.1.

Vulnerability Insight

The following vulnerabilities exist:

- CVE-2020-25718: Samba AD DC does not correctly sandbox Kerberos tickets issued by an RODC
- CVE-2020-25719: Samba AD DC does not always rely on the SID and PAC in Kerberos tickets
- CVE-2020-25721: Kerberos acceptors need easy access to stable AD identifiers (eg objectSid)
- CVE-2020-25722: Samba AD DC does not do suffienct access and conformance checking of data stored
- CVE-2021-3738: Use after free in Samba AD DC RPC server

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Method

Product detection result
`cpe:/a:samba:samba:4.5.9`
`Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)`

Summary
Samba is prone to multiple vulnerabilities.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 4.5.9
Fixed version:     4.5.16
Installation
path / port:       445/tcp
```

Impact

Successful exploitation would result in effects ranging from Denial of Service to Privilege Escalation, eventually allowing an attacker to gain full control over the target system.

Solution:

Solution type: VendorFix

Update to version 4.5.16, 4.6.14 or 4.7.6 respectively.

Affected Software/OS

Samba 4.x.x before 4.5.16, 4.6.x before 4.6.14 and 4.7.x before 4.7.6.

Vulnerability Insight

There exist two vulnerabilities:

- CVE-2018-1050: Samba is vulnerable to a denial of service attack when the RPC spoolss service is configured to be run as an external daemon. Missing input sanitization checks on some of the input parameters to spoolss RPC calls could cause the print spooler service to crash.

- CVE-2018-1057: On a Samba AD DC the LDAP server in Samba incorrectly validates permissions to modify passwords over LDAP allowing authenticated users to change any other users' passwords, including administrative users and privileged service accounts (eg Domain Controllers).

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `Samba 4.x Multiple Vulnerabilities (CVE-2018-1050, CVE-2018-1057)`

OID:1.3.6.1.4.1.25623.1.0.113133

Version used: `2021-06-22T11:00:29Z`

NVT: Samba RCE Vulnerability (CVE-2021-44142)

Product detection result

```
cpe:/a:samba:samba:4.5.9
Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)
```

Summary

Samba is prone to a remote code execution (RCE) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 4.5.9
Fixed version:     4.13.17
Installation
path / port:       445/tcp
```

Solution:

Solution type: VendorFix

Update to version 4.13.17, 4.14.12, 4.15.5 or later.

Affected Software/OS

Samba versions prior to 4.13.17, version 4.14.x through 4.14.11 and 4.15.x through 4.15.4.

Vulnerability Insight

Samba is vulnerable to an out-of-bounds heap read write vulnerability that allows remote attackers to execute arbitrary code as root on affected Samba installations that use the VFS module vfs_fruit.

. . . continues on next page . . .

. . . continued from previous page . . .

The specific flaw exists within the parsing of EA metadata when opening files in smbd. Access as a user that has write access to a file's extended attributes is required to exploit this vulnerability. Note that this could be a guest or unauthenticated user if such users are allowed write access to file extended attributes.
The problem in vfs_fruit exists in the default configuration of the fruit VFS module using fruit:metadata=netatalk or fruit:resource=file. If both options are set to different settings than the default values, the system is not affected by the security issue.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Samba RCE Vulnerability (CVE-2021-44142)`

NVT: Samba Impersonation Vulnerability (CVE-2022-0336)

Product detection result
```
cpe:/a:samba:samba:4.5.9
Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)
```

. . . continues on next page . . .

. . . continued from previous page . . .

Summary
Samba is prone to an impersonation vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 4.5.9
Fixed version:     4.13.17
Installation
path / port:       445/tcp
```

Impact
An attacker who has the ability to write to an account can exploit this to perform a denial of service (DoS) attack by adding an SPN that matches an existing service. Additionally, an attacker who can intercept traffic can impersonate existing services, resulting in a loss of confidentiality and integrity.

Solution:
Solution type: VendorFix
Update to version 4.13.17, 4.14.12, 4.15.5 or later.

Affected Software/OS
Samba version 4.0.0 through 4.13.16, 4.14.x through 4.14.11 and 4.15.x through 4.15.4.

Vulnerability Insight
The Samba AD DC includes checks when adding service principals names (SPNs) to an account to ensure that SPNs do not alias with those already in the database. Some of these checks are able to be bypassed if an account modification re-adds an SPN that was previously present on that account, such as one added when a computer is joined to a domain.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Samba Impersonation Vulnerability (CVE-2022-0336)`

```
cpe:/a:samba:samba:4.5.9
Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)
```

Summary

Samba is prone to a heap based buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 4.5.9
Fixed version:     4.6.16 or apply patch
Installation
path / port:       445/tcp
```

Impact

Successful exploitation will allow an attacker to conduct a denial of service attack.

Solution:

Solution type: VendorFix

Update to version 4.6.16, 4.7.9 or 4.8.4 or later. Please see the references for more information.

Affected Software/OS

Samba versions 3.2.0 through 4.8.3.

Vulnerability Insight

The flaw exists due to insufficient input validation on client directory listing in libsmbclient.

. . . continues on next page . . .

Fixed version:     4.15.12 / 4.16.7 / 4.17.3
Installation
path / port:       445/tcp
```

Solution:
Solution type: VendorFix
Update to version 4.15.12, 4.16.7, 4.17.3 or later.

Affected Software/OS
Samba versions prior to 4.15.12, 4.16.x prior to 4.16.7 and 4.17.x prior to 4.17.3 on 32-bit systems.

Vulnerability Insight
Samba's Kerberos libraries and AD DC failed to guard against integer overflows when parsing a PAC on a 32-bit system, which allowed an attacker with a forged PAC to corrupt the heap.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Samba Buffer Overflow Vulnerability (CVE-2022-42898)`
OID:1.3.6.1.4.1.25623.1.0.104423
Version used: `2023-10-19T05:05:21Z`

Product Detection Result
Product: `cpe:/a:samba:samba:4.5.9`
Method: `SMB NativeLanMan`
OID: 1.3.6.1.4.1.25623.1.0.102011)

NVT: Samba Multiple Vulnerabilities (Jul 2022)

Product detection result

```
cpe:/a:samba:samba:4.5.9
Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)
```

Summary

Samba is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 4.5.9
Fixed version:     4.14.14 / 4.15.9 / 4.16.4
Installation
path / port:       445/tcp
```

Solution:

Solution type: VendorFix

Update to version 4.14.14, 4.15.9, 4.16.4 or later.

Affected Software/OS

Samba versions prior to 4.14.14, 4.15.x prior to 4.15.9 and 4.16.x prior to 4.16.4.

Vulnerability Insight

The following flaws exist:

- CVE-2022-2031: Samba AD users can bypass certain restrictions associated with changing passwords

- CVE-2022-32742: Server memory information leak via SMB1

- CVE-2022-32746: Samba AD users can induce a use-after-free in the server process with an LDAP add or modify request

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Product detection result
cpe:/a:samba:samba:4.5.9
Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)

Summary
Samba is prone to a privilege escalation vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 4.5.9
Fixed version: 4.14.14 / 4.15.9 / 4.16.4
Installation
path / port: 445/tcp

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to version 4.14.14, 4.15.9, 4.16.4 or later.

Affected Software/OS
Samba versions starting from 4.3 and prior to 4.14.14, 4.15.x prior to 4.15.9 and 4.16.x prior to 4.16.4.

Vulnerability Insight
Tickets received by the kpasswd service were decrypted without specifying that only that service's own keys should be tried. By setting the ticket's server name to a principal associated with their own account, or by exploiting a fallback where known keys would be tried until a suitable one was found, an attacker could have the server accept tickets encrypted with any key, including their own.
A user could thus change the password of the Administrator account and gain total control over the domain. Full loss of confidentiality and integrity would be possible, as well as of availability by denying users access to their accounts.
In addition, the kpasswd service would accept tickets encrypted by the krbtgt key of an RODC, in spite of the fact that RODCs should not have been able to authorise password changes.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

cpe:/o:debian:debian_linux:9
Detected by OS Detection Consolidation and Reporting (OID: 1.3.6.1.4.1.25623.1.0
↪.105937)
```

Summary

The Operating System (OS) on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The "Debian GNU/Linux" Operating System on the remote host has reached the end o
↪f life.
CPE:                cpe:/o:debian:debian_linux:9
Installed version,
build or SP:        9
EOL date:           2022-06-30
EOL info:           https://en.wikipedia.org/wiki/List_of_Debian_releases#Release
↪_table
```

Impact

An EOL version of an OS is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:

Solution type: Mitigation

Update the OS on the remote host to a version which is still supported and receiving security updates by the vendor.

Note / Important: Please create an override for this result if the target host is a:

. . . continues on next page . . .

. . . continued from previous page . . .

- Windows system with Extended Security Updates (ESU)
- System with additional 3rd-party / non-vendor security updates like e.g. from 'TuxCare', 'Freexian Extended LTS' or similar

Vulnerability Detection Method
Checks if an EOL version of an OS is present on the target host.
Details: `Operating System (OS) End of Life (EOL) Detection`

2.7.2 Critical 80/tcp

Critical (CVSS: 9.8)
NVT: Apache HTTP Server Multiple Vulnerabilities (Jun 2017) - Linux

Product detection result
`cpe:/a:apache:http_server:2.4.25`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.26
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow remote attackers to bypass authentication and perform unauthorized actions, cause a denial-of-service condition and gain access to potentially sensitive information.

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to Apache HTTP Server 2.2.33 or 2.4.26 or later.

Affected Software/OS
Apache HTTP Server 2.2.x before 2.2.33 and 2.4.x before 2.4.26.

Vulnerability Insight
Multiple flaws exist as,
- The mod_mime can read one byte past the end of a buffer when sending a malicious Content-Type response header.
- The mod_ssl may dereference a NULL pointer when third-party modules call ap_hook_process_connection() during an HTTP request to an HTTPS port.
- An use of the ap_get_basic_auth_pw() by third-party modules outside of the authentication phase may lead to authentication requirements being bypassed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server Multiple Vulnerabilities (Jun 2017) - Linux`

Critical (CVSS: 9.8)
NVT: Apache HTTP Server Multiple Vulnerabilities (Apr 2018) - Linux

Product detection result
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

Installed version:	2.4.25
Fixed version:	2.4.30
Installation path / port:	80/tcp

Impact
Successful exploitation will allow an attacker to replay HTTP requests across servers without detection, influence the user content, upload a malicious file, crash the Apache HTTP Server and perform denial of service attack.

Solution:
Solution type: VendorFix
Update to version 2.4.30 or later. Please see the references for more information.

Affected Software/OS
Apache HTTP Server versions from 2.4.1 to 2.4.4, 2.4.6, 2.4.7, 2.4.9, 2.4.10, 2.4.12, 2.4.16 to 2.4.18, 2.4.20, 2.4.23, 2.4.25 to 2.4.29.

Vulnerability Insight
Multiple flaws exist due to:
- Apache HTTP Server fails to correctly generate the nonce sent to prevent reply attacks.
- Misconfigured mod_session variable, HTTP_SESSION.
- Apache HTTP Server fails to sanitize the expression specified in '<FilesMatch>'.
- An error in Apache HTTP Server 'mod_authnz_ldap' when configured with AuthLDAPCharsetConfig.
- Apache HTTP Server fails to sanitize against a specially crafted request.

Vulnerability Detection Method

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.54
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.54 or later.

Affected Software/OS
Apache HTTP Server version 2.4.53 and prior.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2022-26377: mod_proxy_ajp: Possible request smuggling
- CVE-2022-28614: Read beyond bounds via ap_rwrite()
- CVE-2022-28615: Read beyond bounds in ap_strcmp_match()
- CVE-2022-29404: Denial of service in mod_lua r:parsebody
- CVE-2022-30556: Information disclosure in mod_lua with websockets
- CVE-2022-31813: mod_proxy X-Forwarded-For dropped by hop-by-hop mechanism

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.52
Installation
path / port:       80/tcp
```

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to version 2.4.52 or later.

Affected Software/OS
Apache HTTP Server versions through 2.4.51.

Vulnerability Insight
A carefully crafted request body can cause a buffer overflow in the mod_lua multipart parser (r:parsebody() called from Lua scripts).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux`

NVT: Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux

Product detection result
`cpe:/a:apache:http_server:2.4.25`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to a HTTP request smuggling vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.56
Installation
path / port:       80/tcp
```

Impact
Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

Solution:
Solution type: VendorFix
Update to version 2.4.56 or later.

Affected Software/OS
Apache HTTP Server versions 2.4.0 through 2.4.55.

Vulnerability Insight
Some mod_proxy configurations allow a HTTP Request Smuggling attack.
Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux`

Product detection result

```
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a memory access vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.41
Installation
path / port:       80/tcp
```

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to version 2.4.41 or later.

Affected Software/OS
Apache HTTP Server version 2.4.18 to 2.4.39.

Vulnerability Insight
Using fuzzed network input, the http/2 session handling could be made to read memory after being freed during connection shutdown.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server Memory Access Vulnerability - Linux`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.27
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow remote attackers to cause the target service to crash. A remote user can obtain potentially sensitive information as well on the target system.

Solution:
Solution type: VendorFix
Update to Apache HTTP Server 2.2.34 or 2.4.27 or later.

Affected Software/OS
Apache HTTP Server 2.2.x before 2.2.34 and 2.4.x before 2.4.27.

Vulnerability Insight
The flaw exists due to error in Apache 'mod_auth_digest' which does not properly initialize memory used to process 'Digest' type HTTP Authorization headers.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux`

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.55
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.55 or later.

Affected Software/OS
Apache HTTP Server version 2.4.54 and prior.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2006-20001: mod_dav out of bounds read, or write of zero byte
- CVE-2022-36760: Possible request smuggling in mod_proxy_ajp
- CVE-2022-37436: mod_proxy allows a backend to trigger HTTP response splitting

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Apache HTTP Server 2.4.7 - 2.4.51 Multiple Vulnerabilities - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.52
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 2.4.52 or later.

Affected Software/OS

Apache HTTP Server version 2.4.7 through 2.4.51.

Vulnerability Insight

A crafted URI sent to httpd configured as a forward proxy (ProxyRequests on) can cause a crash (NULL pointer dereference) or, for configurations mixing forward and reverse proxy declarations, can allow for requests to be directed to a declared Unix Domain Socket endpoint (Server Side Request Forgery).

Vulnerability Detection Method

NVT: vsftpd Compromised Source Packages Backdoor Vulnerability

Product detection result
`cpe:/a:beasts:vsftpd:2.3.4`
`Detected by vsFTPd FTP Server Detection (OID: 1.3.6.1.4.1.25623.1.0.111050)`

Summary
vsftpd is prone to a backdoor vulnerability.

Quality of Detection (QoD): 99%

Vulnerability Detection Result
Vulnerability was detected according to the Vulnerability Detection Method.

Impact
Attackers can exploit this issue to execute arbitrary commands in the context of the application. Successful attacks will compromise the affected application.

Solution:
Solution type: VendorFix
The repaired package can be downloaded from the referenced vendor homepage. Please validate the package with its signature.

Affected Software/OS
The vsftpd 2.3.4 source package downloaded between 20110630 and 20110703 is affected.

Vulnerability Insight
The tainted source package contains a backdoor which opens a shell on port 6200/tcp.

. . . continues on next page . . .

2.8.2 Critical 80/tcp

Critical (CVSS: 10.0)
NVT: PHP 4.3.x < 5.2.7 Buffer Overflow Vulnerability

Product detection result
`cpe:/a:php:php:5.2.4`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 5.2.4
Fixed version:     5.2.7
Installation
path / port:       80/tcp
```

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

Successful exploitation could allow attackers to execute arbitrary code via a crafted string containing an HTML entity.

Solution:
Solution type: VendorFix
Update to version 5.2.7 or later.

Affected Software/OS
PHP versions 4.3.x through 5.2.6.

Vulnerability Insight
An error exists in mbfilter_htmlent.c file in the mbstring extension. These can be exploited via mb_convert_encoding, mb_check_encoding, mb_convert_variables, and mb_parse_str functions.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Product detection result

```
cpe:/a:php:php:5.2.4
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     5.2.12
Installation
path / port:       80/tcp
```

Impact

Attackers can exploit the code execution vulnerability to execute arbitrary code within the context of the PHP process. This may allow them to bypass intended security restrictions or gain elevated privileges.
An attacker may leverage the cross-site scripting vulnerability to execute arbitrary script code in the browser of an unsuspecting user in the context of the affected site. This may let the attacker steal cookie-based authentication credentials and launch other attacks.

Solution:
Solution type: VendorFix
Update to version 5.2.12 or later.

Affected Software/OS

PHP versions prior to 5.2.12.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.2.12 Multiple Vulnerabilities`

Critical (CVSS: 10.0)
NVT: TWiki < 4.2.4 Multiple XSS / Command Execution Vulnerabilities

Summary
TWiki is prone to multiple cross-site scripting (XSS) and command execution vulnerabilities.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
Installed version: 01.Feb.2003
Fixed version: 4.2.4

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

Successful exploitation could allow execution of arbitrary script code or commands. This could let attackers steal cookie-based authentication credentials or compromise the affected application.

Solution:
Solution type: VendorFix
Update to version 4.2.4 or later.

Affected Software/OS
TWiki versions prior to 4.2.4.

Vulnerability Insight
The flaws are due to:
- %URLPARAM}}% variable is not properly sanitized which lets attackers conduct cross-site scripting attack.
- %SEARCH}}% variable is not properly sanitised before being used in an eval() call which lets the attackers execute perl code through eval injection attack.

Vulnerability Detection Method
Details: `TWiki < 4.2.4 Multiple XSS / Command Execution Vulnerabilities`

NVT: Apache HTTP Server End of Life (EOL) Detection - Linux

Product detection result
```
cpe:/a:apache:http_server:2.2.8
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary
The Apache HTTP Server version on the remote host has reached the End of Life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
The "Apache HTTP Server" version on the remote host has reached the end of life.
CPE:                cpe:/a:apache:http_server:2.2.8
Installed version: 2.2.8
Location/URL:       80/tcp
EOL version:        2.2
EOL date:           2017-12-31
```

Impact

An EOL version of the Apache HTTP Server is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:

Solution type: VendorFix

Update the Apache HTTP Server version on the remote host to a still supported version.

Vulnerability Detection Method

Checks if an EOL version is present on the target host.

Details: `Apache HTTP Server End of Life (EOL) Detection - Linux`

Critical (CVSS: 10.0)
NVT: PHP 5.3.x < 5.3.7 Multiple Security Vulnerabilities

Product detection result
`cpe:/a:php:php:5.2.4`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 5.2.4
Fixed version:     5.3.7
Installation
path / port:       80/tcp
```

Impact
An attacker can exploit these issues to execute arbitrary code, crash the affected application, gain and bypass security restrictions. Other attacks are also possible.

Solution:
Solution type: VendorFix
Update to version 5.3.7 or later.

Affected Software/OS
PHP prior to version 5.3.7.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP 5.3.x < 5.3.7 Multiple Security Vulnerabilities`

. . . continues on next page . . .

. . . continued from previous page . . .

NVT: PHP End of Life (EOL) Detection - Linux

Product detection result
`cpe:/a:php:php:5.2.4`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
The PHP version on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "PHP" version on the remote host has reached the end of life.
CPE:                cpe:/a:php:php:5.2.4
Installed version: 5.2.4
EOL version:        5.2
EOL date:           2011-01-06
```

Impact
An EOL version of PHP is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: VendorFix
Update the PHP version on the remote host to a still supported version.

Vulnerability Insight
Each release branch of PHP is fully supported for two years from its initial stable release. During this period, bugs and security issues that have been reported are fixed and are released in regular point releases.
After this two year period of active support, each branch is then supported for an additional year for critical security issues only. Releases during this period are made on an as-needed basis: there may be multiple point releases, or none, depending on the number of reports.
Once the three years of support are completed, the branch reaches its end of life and is no longer supported.

Vulnerability Detection Method
Checks if an EOL version is present on the target host.
Details: `PHP End of Life (EOL) Detection - Linux`

Critical (CVSS: 9.8)
NVT: PHP < 5.5.33, 5.6.x < 5.6.19 Multiple Vulnerabilities (Apr 2016) - Linux

Product detection result
`cpe:/a:php:php:5.2.4`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     5.5.33
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to gain access to potentially sensitive information and conduct a denial of service (memory corruption and application crash).

Solution:
Solution type: VendorFix
Update to PHP version 5.5.33, 5.6.19 or later.

Affected Software/OS
PHP prior to version 5.5.33 and 5.6.x prior to 5.6.19 on Linux.

Vulnerability Insight
The following flaws exist:
- Use-after-free error in wddx.c script in the WDDX extension in PHP
- Error in the phar_parse_zipfile function in zip.c script in the PHAR extension in PHP.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.33, 5.6.x < 5.6.19 Multiple Vulnerabilities (Apr 2016) - Linux`

```
cpe:/a:php:php:5.2.4
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a remote code execution (RCE) or denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     7.0.12
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 7.0.12 or later.

Affected Software/OS

. . . continues on next page . . .

. . . continued from previous page . . .

PHP versions prior to 7.0.12.

Vulnerability Insight
The SplObjectStorage unserialize implementation in ext/spl/spl_observer.c does not verify that a key is an object, which allows remote attackers to execute arbitrary code or cause a denial of service (uninitialized memory access) via crafted serialized data.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 7.0.12 RCE / DoS Vulnerability - Linux`

```

. . . continues on next page . . .

. . . continued from previous page . . .

Impact
Successfully exploiting these issues allow remote attackers to cause a denial of service (buffer overflow and application crash) or possibly execute arbitrary code.

Solution:
Solution type: VendorFix
Update to PHP version 5.5.37, 5.6.23, 7.0.8 or later.

Affected Software/OS
PHP prior to version 5.5.37, 5.6.x prior to 5.6.23 and 7.x prior to 7.0.8 on Linux.

Vulnerability Insight
The following flaws exist:
- The 'php_zip.c' script in the zip extension improperly interacts with the unserialize implementation and garbage collection.
- The php_wddx_process_data function in 'wddx.c' script in the WDDX extension mishandled data in a wddx_deserialize call.
- The multiple integer overflows in 'mcrypt.c' script in the mcrypt extension.
- The double free vulnerability in the '_php_mb_regex_ereg_replace_exec' function in 'php_mbregex.c' script in the mbstring extension.
- An integer overflow in the '_gd2GetHeader' function in 'gd_gd2.c' script in the GD Graphics Library.
- An integer overflow in the 'gdImageCreate' function in 'gd.c' script in the GD Graphics Library.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Product detection result

```
cpe:/a:php:php:5.2.4
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple denial of service (DoS) vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     5.6.27
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues allows a remote attacker to cause a DoS, or possibly have unspecified other impact.

Solution:

Solution type: VendorFix

Update to version 5.6.27, 7.0.12 or later.

Affected Software/OS

PHP prior to version 5.6.27 and 7.0.x through 7.0.11.

Vulnerability Insight

The following flaws exist:
- Integer Overflow in gdImageWebpCtx of gd_webp.c
- Use After Free in PHP7 unserialize()

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     5.5.37
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to cause a denial of service (use-after-free and application crash) or possibly execute arbitrary code or possibly have unspecified other impact via a large integer argument.

Solution:

Solution type: VendorFix

Update to version 5.5.37, 5.6.23 or later.

Affected Software/OS

PHP prior to version 5.5.37 and 5.6.x prior to 5.6.23 on Linux.

Vulnerability Insight

The following flaws exist:

- The 'spl_array.c' in the SPL extension improperly interacts with the unserialize implementation and garbage collection.

- Integer overflow in the 'SplFileObject::fread' function in 'spl_directory.c' in the SPL extension.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: phpMyAdmin < 4.9.6, 5.x < 5.0.3 Multiple Vulnerabilities (PMASA-2020-5, PMASA-2020-6) - Linux

Summary
phpMyAdmin is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.1.1
Fixed version:     4.9.6
Installation
path / port:       /phpMyAdmin
```

Impact
Successful exploitation would allow an attacker to:
- If an attacker sends a crafted link to the victim with the malicious JavaScript, when the victim clicks on the link, the JavaScript will run and complete the instructions made by the attacker (CVE-2020-26934)
- An attacker could use this flaw to inject malicious SQL in to a query (CVE-2020-26935)

Solution:
Solution type: VendorFix
Update to version 4.9.6, 5.0.3 or later.

Affected Software/OS
phpMyAdmin prior to version 4.9.6 and 5.x prior to 5.0.3.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
The following vulnerabilities exist:
- XSS relating to the transformation feature (CVE-2020-26934)
- SQL injection vulnerability in SearchController (CVE-2020-26935)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `phpMyAdmin < 4.9.6, 5.x < 5.0.3 Multiple Vulnerabilities (PMASA-2020-5, PMASA-2.`

Product detection result
`cpe:/a:php:php:5.2.4`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple denial of service (DoS) vulnerabilities.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     None
Installation
path / port:       80/tcp
```

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
PHP versions through 7.1.5.

Vulnerability Insight
The following flaws exist:
- CVE-2017-8923: The zend_string_extend function in Zend/zend_string.h does not prevent changes to string objects that result in a negative length, which allows remote attackers to cause a denial of service (application crash) or possibly have unspecified other impact by leveraging a script's use of .= with a long string.
- CVE-2017-9119: The i_zval_ptr_dtor function in Zend/zend_variables.h allows attackers to cause a denial of service (memory consumption and application crash) or possibly have unspecified other impact by triggering crafted operations on array data structures.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP <= 7.1.5 Multiple DoS Vulnerabilities`

Critical (CVSS: 9.8)
NVT: phpMyAdmin Code Injection and XSS Vulnerability

Summary
phpMyAdmin is prone to a remote PHP code-injection vulnerability and to a cross-site scripting vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.1.1
Fixed version:     2.11.9.5 / 3.1.3.1
```

Impact
An attacker can exploit this issue to inject and execute arbitrary malicious PHP code in the context of the webserver process. This may facilitate a compromise of the application and the underlying system. Other attacks are also possible.

Solution:
Solution type: VendorFix
Update to version 2.11.9.5 / 3.1.3.1 or later.

Affected Software/OS
Versions prior to phpMyAdmin 2.11.9.5 and 3.1.3.1 are vulnerable.

Vulnerability Detection Method
Details: `phpMyAdmin Code Injection and XSS Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.100077
Version used: `2024-07-17T05:05:38Z`

Critical (CVSS: 9.8)
NVT: PHP < 5.2.6 Multiple Vulnerabilities (Aug 2008)

Product detection result
`cpe:/a:php:php:5.2.4`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     5.2.6
Installation
path / port:       80/tcp
```

Impact
Successful exploitation could result in remote arbitrary code execution, security restrictions bypass, access to restricted files, denial of service.

Solution:
Solution type: VendorFix
Update to version 5.2.6 or later.

Affected Software/OS
PHP version prior to 5.2.6.

Vulnerability Insight
The following flaws exist:
- CVE-2007-4850: Error in curl/interface.c in the cURL library(libcurl), which could be exploited by attackers to bypass safe_mode security restrictions.
- CVE-2008-0599: Error during path translation in cgi_main.c.
- CVE-2008-0674: Buffer overflow error in PCRE when handling a character class containing a very large number of characters with codepoints greater than 255(UTF-8 mode).
- CVE-2008-2050: Stack-based buffer overflow in FastCGI SAPI (fastcgi.c).
- CVE-2008-2051: Unspecified error within the processing of incomplete multibyte characters in escapeshellcmd() API function

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: PHP < 7.1.33, 7.2.x < 7.2.24, 7.3.x < 7.3.11 RCE Vulnerability - Version Check

Product detection result
cpe:/a:php:php:5.2.4
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to a remote code execution (RCE) vulnerability in certain nginx + php-fpm configurations.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 5.2.4
Fixed version: 7.1.33
Installation
path / port: 80/tcp

. . . continues on next page . . .

. . . continued from previous page . . .

Impact
Successful exploitation would allow an unauthenticated remote attacker to execute arbitrary code on the target machine.

Solution:
Solution type: VendorFix
Update to version 7.1.33, 7.2.24, 7.3.11 or later.
As an alternative a workaround to update the nginx configuration to mitigate this vulnerability is described at the PHP.net bugtracker linked in the references.

Affected Software/OS
PHP prior to version 7.1.33, 7.2.x prior to 7.2.24 and 7.3.x prior to 7.3.11.

Vulnerability Insight
The file sapi/fpm/fpm/fpm_main.c contains pointer arithmetic that assumes that env_path_info has a prefix equal to the path to the php script. However, the code does not check this assumption is satisfied. The absence of the check can lead to an invalid pointer in the 'path_info' variable.
Such conditions can be achieved in a pretty standard Nginx configuration. The regexp in 'fastcgi_split_path_info' directive can be broken using the newline character (in encoded form, %0a). Broken regexp leads to empty PATH_INFO, which triggers the bug.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 7.1.33, 7.2.x < 7.2.24, 7.3.x < 7.3.11 RCE Vulnerability - Version Check`

Product detection result
`cpe:/a:php:php:5.2.4`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     8.1.31
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.1.31, 8.2.26, 8.3.14 or later.

Affected Software/OS
PHP versions prior to 8.1.31, 8.2.x prior to 8.2.26 and 8.3.x prior to 8.3.14.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2024-8929: Leak partial content of the heap through heap buffer over-read
- CVE-2024-8932: OOB access in ldap_escape
- CVE-2024-11233: Single byte overread with convert.quoted-printable-decode filter
- CVE-2024-11234: Configuring a proxy in a stream context might allow for CRLF injection in URIs
- CVE-2024-11236: Integer overflow in the firebird/dblib quoter causing OOB writes
- No CVE: Heap-Use-After-Free in sapi_read_post_data Processing in CLI SAPI Interface

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: PHP < 5.6.26, 7.x < 7.0.11 Multiple Vulnerabilities (Sep 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.2.4
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     5.6.26
Installation
path / port:       80/tcp
```

. . . continues on next page . . .

. . . continued from previous page . . .

Impact
Successfully exploiting this issue allow remote attackers to cause a denial of service, or possibly have unspecified other impact.

Solution:
Solution type: VendorFix
Update to version 5.6.26, 7.0.11 or later.

Affected Software/OS
PHP prior to version 5.6.26 and 7.x prior to 7.0.11 on Linux.

Vulnerability Insight
The following flaws exist:
- Use-after-free vulnerability in the 'wddx_stack_destroy' function in 'ext/wddx/wddx.c' script.
- Improper verification of a BIT field has the UNSIGNED_FLAG flag in 'ext/mysqlnd/mysqlnd_wireprotocol.c' script.
- The ZIP signature-verification feature does not ensure that the uncompressed_filesize field is large enough.
- The script 'ext/spl/spl_array.c' proceeds with SplArray unserialization without validating a return value and data type.
- The script 'ext/intl/msgformat/msgformat_format.c' does not properly restrict the locale length provided to the Locale class in the ICU library.
- An error in the php_wddx_push_element function in ext/wddx/wddx.c.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: phpMyAdmin 2.11.x < 2.11.9.4 / 3.0.x < 3.1.3 Multiple Vulnerabilities

Summary
phpMyAdmin is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.1.1
Fixed version:     2.11.9.5/3.1.3.1
```

Impact
Successful exploitation will let the attacker cause XSS, Directory Traversal attacks or can injection malicious PHP Codes to gain sensitive information about the remote host.

Solution:
Solution type: VendorFix
Upgrade to version 2.11.9.5 or 3.1.3.1 or later.

Affected Software/OS
phpMyAdmin version 2.11.x to 2.11.9.4 and 3.0.x to 3.1.3.

Vulnerability Insight
Multiple flaws are due to:

. . . continues on next page . . .

. . . continued from previous page . . .

- BLOB streaming feature in 'bs_disp_as_mime_type.php' causes CRLF Injection which lets the attacker inject arbitrary data in the HTTP headers through the 'c_type' and 'file_type' parameters.
- XSS Vulnerability in 'display_export.lib.php' as its not sanitizing the 'pma_db_filename_template' parameter.
- Static code injection vulnerability in 'setup.php' which can be used to inject PHP Codes.
- Filename 'bs_disp_as_mime_type.php' which is not sanitizing user supplied inputs in the filename variable which causes directory traversal attacks.

Fixed version:     5.4.44
Installation
```

. . . continues on next page . . .

. . . continued from previous page . . .

path / port: 80/tcp

Impact
Successfully exploiting this issue allow remote attackers to cause a denial of service (NULL pointer dereference and application crash) or trigger unintended method execution to defeat cryptographic protection mechanisms.

Solution:
Solution type: VendorFix
Update to version 5.4.44, 5.5.28, 5.6.12 or later.

Affected Software/OS
PHP prior to version 5.4.44, 5.5.x prior to 5.5.28 and 5.6.x prior to 5.6.12 on Linux.

Vulnerability Insight
Multiple flaws exist due to:
- An improper validation of certain Exception objects in 'Zend/zend_exceptions.c' script.
- The 'openssl_random_pseudo_bytes' function in 'ext/openssl/openssl.c' incorrectly relies on the deprecated 'RAND_pseudo_bytes' function.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: PHP < 5.4.44, 5.5.x < 5.5.28, 5.6.x < 5.6.12 Multiple Vulnerabilities (Jul 2016. ↪..

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     8.1.29
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 8.1.29, 8.2.20, 8.3.8 or later.

Affected Software/OS

PHP prior to version 8.1.29, version 8.2.x through 8.2.19 and 8.3.x through 8.3.7.

Vulnerability Insight

The following vulnerabilities exist:
- CVE-2024-4577: Argument injection in PHP-CGI (bypass of CVE-2012-1823)
- CVE-2024-5458: Filter bypass in filter_var FILTER_VALIDATE_URL
- CVE-2024-5585: Bypass of CVE-2024-1874

Note: As of 06/2024 the CVEs CVE-2024-4577 and CVE-2024-5585 are known to be exploitable on Windows systems only.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.
Details: `PHP < 8.1.29, 8.2.x < 8.2.20, 8.3.x < 8.3.8 Multiple Vulnerabilities - Linux`

Summary
PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     None
Installation
path / port:       80/tcp
```

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
PHP versions through 5.6.27 and 7.0.x through 7.0.12.

Vulnerability Insight
PHP mishandles property modification during __wakeup processing, which allows remote attackers to cause a denial of service or possibly have unspecified other impact via crafted serialized data, as demonstrated by Exception::__toString with DateInterval::__wakeup.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP <= 5.6.27 / 7.0.x <= 7.0.12 DoS Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.117802

Product detection result
`cpe:/a:php:php:5.2.4`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to a stack buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     5.6.34
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow an attacker to execute arbitrary code in the context of the affected application. Failed exploit attempts will result in denial-of-service conditions.

Solution:
Solution type: VendorFix
Update to version 5.6.34, 7.0.28, 7.1.15, 7.2.3 or later.

Affected Software/OS
PHP versions 5.x prior to 5.6.34, 7.x prior to 7.0.28, 7.1.x prior to 7.1.15 and 7.2.x prior to 7.2.3 on Linux.

Vulnerability Insight
The flaw exists because php fails to adequately bounds-check user-supplied data before copying it into an insufficiently sized buffer.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP 5.x < 5.6.34, 7.x < 7.0.28, 7.1.x < 7.1.15, 7.2.x < 7.2.3 Stack Buffer Over.`

NVT: PHP < 5.6.25, 7.x < 7.0.10 Multiple Vulnerabilities (Sep 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.2.4
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     5.6.25
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to cause a denial of service, to obtain sensitive information from process memory, to inject arbitrary-type session data by leveraging control of a session name.

Solution:
Solution type: VendorFix

. . . continues on next page . . .

. . . continued from previous page . . .

Update to version 5.6.25, 7.0.10 or later.

Affected Software/OS
PHP prior to version 5.6.25 and 7.x prior to 7.0.10 on Linux.

Vulnerability Insight
The following flaws exist:
- Invalid wddxPacket XML document that is mishandled in a wddx_deserialize call in 'ext/wddx/wddx.c' script.
- Error in 'php_wddx_pop_element' function in 'ext/wddx/wddx.c' script.
- An error in 'php_wddx_process_data' function in 'ext/wddx/wddx.c' script.
- Improper handling of the case of a thumbnail offset that exceeds the file size in 'exif_process_IFD_in_TIFF' function in 'ext/exif/exif.c' script.
- Improper validation of gamma values in 'imagegammacorrect' function in 'ext/gd/gd.c' script.
- Improper validation of number of colors in 'imagegammacorrect' function in 'ext/gd/gd.c' script.
- The script 'ext/session/session.c' skips invalid session names in a way that triggers incorrect parsing.
- Improper handling of certain objects in 'ext/standard/var_unserializer.c' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: PHP < 5.4.40, 5.5.x < 5.5.24, 5.6.x < 5.6.8 Multiple Vulnerabilities - Linux

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     5.4.40
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to cause a denial of service, to obtain sensitive information from process memory and to execute arbitrary code via crafted dimensions.

Solution:
Solution type: VendorFix
Update to version 5.4.40, 5.5.24, 5.6.8 or later.

Affected Software/OS
PHP prior to version 5.4.40, 5.5.x prior to 5.5.24 and 5.6.x prior to 5.6.8.

Vulnerability Insight
The following flaws exist:
- Multiple stack-based buffer overflows in the 'phar_set_inode' function in phar_internal.h script in PHP.
- Vulnerabilities in 'phar_parse_metadata' and 'phar_parse_pharfile' functions in ext/phar/phar.c script in PHP.
- A NULL pointer dereference flaw in the 'build_tablename' function in 'ext/pgsql/pgsql.c' script that is triggered when handling NULL return values for 'token'

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.4.40, 5.5.x < 5.5.24, 5.6.x < 5.6.8 Multiple Vulnerabilities - Linux`

Product detection result

```
cpe:/a:php:php:5.2.4
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     5.4.43
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to execute arbitrary code in the context of the PHP process. Failed exploit attempts will likely crash the webserver.

Solution:

. . . continues on next page . . .

. . . continued from previous page . . .

Solution type: VendorFix
Update to version 5.4.43, 5.5.27, 5.6.11 or later.

Affected Software/OS
PHP prior to version 5.4.43, 5.5.x prior to 5.5.27 and 5.6.x prior to 5.6.11 on Linux.

Vulnerability Insight
The following flaws exist:
- Inadequate boundary checks on user-supplied input by 'phar_fix_filepath' function in 'ext/phar/phar.c' script.
- Improper validation of file pointer in the 'phar_convert_to_other' function in 'ext/phar/phar_object.c' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Apache HTTP Server Multiple Vulnerabilities (Jun 2017) - Linux

Product detection result

```
cpe:/a:apache:http_server:2.2.8
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.2.8
Fixed version:     2.2.33
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow remote attackers to bypass authentication and perform unauthorized actions, cause a denial-of-service condition and gain access to potentially sensitive information.

Solution:

Solution type: VendorFix

Update to Apache HTTP Server 2.2.33 or 2.4.26 or later.

Affected Software/OS

Apache HTTP Server 2.2.x before 2.2.33 and 2.4.x before 2.4.26.

Vulnerability Insight

Multiple flaws exist as,

- The mod_mime can read one byte past the end of a buffer when sending a malicious Content-Type response header.

- The mod_ssl may dereference a NULL pointer when third-party modules call ap_hook_process_connection() during an HTTP request to an HTTPS port.

. . . continues on next page . . .

. . . continued from previous page . . .

- An use of the ap_get_basic_auth_pw() by third-party modules outside of the authentication phase may lead to authentication requirements being bypassed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: PHP < 5.5.35, 5.6.x < 5.6.21, 7.x < 7.0.6 Multiple Vulnerabilities (Jul 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.2.4
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     5.5.35
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to cause a denial of service (out-of-bounds read) or possibly have unspecified other impact.

Solution:

Solution type: VendorFix

Update to version 5.5.35, 5.6.21, 7.0.6 or later.

Affected Software/OS

PHP prior to version 5.5.35, 5.6.x prior to 5.6.21 and 7.x prior to 7.0.6 on Linux.

Vulnerability Insight

The following flaws exist:

- Improper validation of TIFF start data in 'exif_process_TIFF_in_JPEG' function in 'ext/exif/exif.c' script.

- Improper validation of IFD sizes in 'exif_process_TIFF_in_JPEG' function in 'ext/exif/exif.c' script.

. . . continues on next page . . .

. . . continued from previous page . . .

- Improper construction of spprintf arguments, in 'exif_process_TIFF_in_JPEG' function in 'ext/exif/exif.c' script.
- Error in 'grapheme_strpos function' in 'ext/intl/grapheme/grapheme_string.c'.
- Error in 'xml_parse_into_struct' function in 'ext/xml/xml.c' script.
- The 'bcpowmod' function in 'ext/bcmath/bcmath.c' improperly modifies certain data structures.
- Improper validation of input passed to 'bcpowmod' function in 'ext/bcmath/bcmath.c' script.
- Error in 'grapheme_strpos' function in ext/intl/grapheme/grapheme_string.c script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.35, 5.6.x < 5.6.21, 7.x < 7.0.6 Multiple Vulnerabilities (Jul 2016) -. ↪..`

```
Fixed version:     5.5.34
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to cause a denial of service (buffer overflow and application crash) or possibly execute arbitrary code.

Solution:
Solution type: VendorFix
Update to version 5.5.34, 5.6.20, 7.0.5 or later.

Affected Software/OS
PHP prior to version 5.5.34, 5.6.x prior to 5.6.20 and 7.0.x prior to 7.0.5 on Linux.

Vulnerability Insight
The following flaws exist:
- Multiple integer overflows in the mbfl_strcut function in 'ext/mbstring/libmbfl/mbfl/mbfilter.c' script.
- Format string vulnerability in the php_snmp_error function in 'ext/snmp/snmp.c' script.
- An improper handling of '\0' characters by the 'phar_analyze_path' function in 'ext/phar/phar.c' script.
- An integer overflow in the 'php_raw_url_encode' function in 'ext/standard/url.c' script.
- An improper handling of continuation-level jumps in 'file_check_mem' function in 'funcs.c' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.34, 5.6.x < 5.6.20, 7.x < 7.0.5 Multiple Vulnerabilities (Jul 2016) -.`

Product detection result

```
cpe:/a:php:php:5.2.4
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     5.4.45
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to read arbitrary empty directories, also to cause a denial of service.

Solution:
Solution type: VendorFix
Update to version 5.4.45, 5.5.29, 5.6.13 or later.

Affected Software/OS
PHP prior to version 5.4.45, 5.5.x prior to 5.5.29 and 5.6.x prior to 5.6.13 on Linux.

Vulnerability Insight
The following flaws exist:
- Error in the 'ZipArchive::extractTo' function in 'ext/zip/php_zip.c' script.
- The xsl_ext_function_php function in ext/xsl/xsltprocessor.c when libxml2 is used, does not consider the possibility of a NULL valuePop return value before proceeding with a free operation after the principal argument loop.
- Improper handling of multiple php_var_unserialize calls
- Multiple use-after-free vulnerabilities

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

. . . continued from previous page . . .

path / port: 80/tcp

Impact
Successfully exploiting these issues may allow attackers to cause a denial of service obtain sensitive information from process memory, or possibly have unspecified other impact.

Solution:
Solution type: VendorFix
Update to version 5.5.38, 5.6.24, 7.0.9 or later.

Affected Software/OS
PHP prior to version 5.5.38, 5.6.x prior to 5.6.24 and 7.x prior to 7.0.9.

Vulnerability Insight
The following flaws exist:
- Integer overflow in the 'php_stream_zip_opener' function in 'ext/zip/zip_stream.c'
- Integer signedness error in the 'simplestring_addn' function in 'simplestring.c' in xmlrpc-epi
- 'ext/snmp/snmp.c' improperly interacts with the unserialize implementation and garbage collection
- The 'locale_accept_from_http' function in 'ext/intl/locale/locale_methods.c' does not properly restrict calls to the ICU 'uloc_acceptLanguageFromHTTP' function
- Error in the 'exif_process_user_comment' function of 'ext/exif/exif.c'
- Error in the 'exif_process_IFD_in_MAKERNOTE' function of 'ext/exif/exif.c'
- 'ext/session/session.c' does not properly maintain a certain hash data structure
- Integer overflow in the 'virtual_file_ex' function of 'TSRM/tsrm_virtual_cwd.c'
- Error in the 'php_url_parse_ex' function of 'ext/standard/url.c'
- Integer overflow error within _gdContributionsAlloc()
- Inadequate error handling in bzread()

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: PHP < 5.5.38, 5.6.x < 5.6.24, 7.0.x < 7.0.9 Multiple Vulnerabilities (Jul 2016).

Critical (CVSS: 9.8)
NVT: PHP < 5.5.27, 5.6.x < 5.6.11 Arbitrary Code Execution Vulnerability (Aug 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.2.4
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to an arbitrary code execution vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     5.5.27
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to execute arbitrary code by triggering a failed SplMinHeap::compare operation.

Solution:

Solution type: VendorFix

Update to version 5.5.27, 5.6.11 or later.

Affected Software/OS

PHP prior to version 5.5.27 and 5.6.x prior to 5.6.11 on Linux.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

An use-after-free vulnerability occurs in the 'spl_ptr_heap_insert' function in 'ext/spl/spl_heap.c'.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: PHP < 5.6.7 DoS Vulnerability - Linux

Product detection result
`cpe:/a:php:php:5.2.4`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
`Installed version: 5.2.4`

. . . continues on next page . . .

. . . continued from previous page . . .

```
Fixed version:     5.6.7
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting this issue allow remote attackers to cause a denial of service.

Solution:
Solution type: VendorFix
Update to version 5.6.7 or later.

Affected Software/OS
PHP prior to version 5.6.7 on Linux.

Vulnerability Insight
The flaw is due to 'type confusion' issues in 'ext/soap/php_encoding.c', 'ext/soap/php_http.c', and 'ext/soap/soap.c' scripts.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.7 DoS Vulnerability - Linux`
OID:1.3.6.1.4.1.25623.1.0.808673

NVT: PHP < 5.4.42, 5.5.x < 5.5.26, 5.6.x < 5.6.10 Multiple Vulnerabilities (Aug 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.2.4
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

. . . continues on next page . . .

. . . continued from previous page . . .

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 5.2.4
Fixed version:     5.4.42
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to cause a denial of service, to read or write to arbitrary files, also execute arbitrary code via a long reply to a LIST command, leading to a heap-based buffer overflow.

Solution:
Solution type: VendorFix
Update to version 5.4.42, 5.5.26, 5.6.10 or later.

Affected Software/OS
PHP prior to version 5.4.42, 5.5.x prior to 5.5.26 and 5.6.x prior to 5.6.10 on Linux.

Vulnerability Insight
The following flaws exist:
- Improper validation of token extraction for table names, in the php_pgsql_meta_data function in pgsql.c in the PostgreSQL extension.
- Integer overflow in the ftp_genlist function in ext/ftp/ftp.c
- PHP does not ensure that pathnames lack %00 sequences.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Summary

PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     5.6.29
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 5.6.29, 7.0.14 or later.

Affected Software/OS

PHP versions prior to 5.6.29 and 7.0.x prior to 7.0.14.

Vulnerability Insight

The php_wddx_push_element function in ext/wddx/wddx.c allows remote attackers to cause a denial of service (out-of-bounds read and memory corruption) or possibly have unspecified other impact via an empty boolean element in a wddxPacket XML document.

↪p5/cgi </td></tr>
  <h2>PHP Core</h2>
  <h2>PHP Variables</h2>
```

Impact
Exploiting this issue allows remote attackers to view the source code of files in the context of the server process. This may allow the attacker to obtain sensitive information and to run arbitrary PHP code on the affected computer. Other attacks are also possible.

Solution:
Solution type: VendorFix
PHP: Update to version 5.3.13, 5.4.3 or later
- Other products / applications: Please contact the vendor for a solution

Affected Software/OS
PHP versions prior to 5.3.13 and 5.4.x prior to 5.4.3.
Other products / applications might be affected by the tested CVE-2012-1823 as well.

Vulnerability Insight
When PHP is used in a CGI-based setup (such as Apache's mod_cgid), the php-cgi receives a processed query string parameter as command line arguments which allows command-line switches, such as -s, -d or -c to be passed to the php-cgi binary, which can be exploited to disclose source code and obtain arbitrary code execution.
An example of the -s command, allowing an attacker to view the source code of index.php is below:
http://example.com/index.php?-s

Vulnerability Detection Method
Send multiple a crafted HTTP POST requests and checks the responses.
Notes:
- This script checks for the presence of CVE-2012-1823 which indicates that the system is also affected by the other included CVEs.

. . . continues on next page . . .

. . . continued from previous page . . .

- It is currently expected that a result of this VT is reported if the system is generally exposing a phpinfo() output on the relevant URL / endpoint (independent from the running product). Exposing such sensitive information is generally seen as a security misconfiguration and should be avoided.

Critical (CVSS: 9.8)
NVT: Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux

Product detection result
cpe:/a:apache:http_server:2.2.8
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)

Summary
Apache HTTP Server is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.2.8
Fixed version:     2.4.52
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.52 or later.

Affected Software/OS
Apache HTTP Server versions through 2.4.51.

Vulnerability Insight
A carefully crafted request body can cause a buffer overflow in the mod_lua multipart parser (r:parsebody() called from Lua scripts).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux

Update to version 2.4.60 or later.

Affected Software/OS
Apache HTTP Server version 2.4.59 and prior.

Vulnerability Insight
The following flaws exist:
- CVE-2024-36387: Denial of Service (DoS) by Null pointer in websocket over HTTP/2
- CVE-2024-38473: Proxy encoding problem
- CVE-2024-38474: Weakness with encoded question marks in backreferences
- CVE-2024-38475: Weakness in mod_rewrite when first segment of substitution matches filesystem path
- CVE-2024-38476: May use exploitable/malicious backend application output to run local handlers via internal redirect
- CVE-2024-38477: Crash resulting in DoS in mod_proxy via a malicious request
- CVE-2024-39573: mod_rewrite proxy handler substitution

Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     5.6.31
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to leak information from the interpreter, crash PHP interpreter and also disclose sensitive information.

Solution:
Solution type: VendorFix
Update to version 5.6.31, 7.0.21, 7.1.7 or later.

Affected Software/OS
PHP prior to version 5.6.31, 7.0.x prior to 7.0.21 and 7.1.x prior to 7.1.7.

Vulnerability Insight
The following vulnerabilities exist:
- An ext/date/lib/parse_date.c out-of-bounds read affecting the php_parse_date function.
- The openssl extension PEM sealing code did not check the return value of the OpenSSL sealing function.
- lack of bounds checks in the date extension's timelib_meridian parsing code.
- A stack-based buffer overflow in the zend_ini_do_op() function in the 'Zend/zend_ini_parser.c' script.
- The GIF decoding function gdImageCreateFromGifCtx in gd_gif_in.c in the GD Graphics Library (aka libgd) does not zero colorMap arrays before use.
- Heap buffer overread (READ: 1) finish_nested_data from unserialize
- oniguruma upstream fix

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: PHP < 5.6.31, 7.0.x < 7.0.21, 7.1.x < 7.1.7 Multiple Vulnerabilities (Jul 2017). ↪..

NVT: PHP 'CVE-2019-13224' Use-After-Free Vulnerability - Linux

Product detection result

```
cpe:/a:php:php:5.2.4
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a use-after-free vulnerability in a used third-pary library.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     7.1.32
Installation
path / port:       80/tcp
```

Impact

This flaw allows attackers to potentially cause information disclosure, denial of service, or possibly code execution by providing a crafted regular expression.

Solution:

Solution type: VendorFix

Update to version 7.1.32, 7.3.9 or later.

Affected Software/OS

PHP version before 7.1.32 and 7.3.x before 7.3.9.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

The flaw exists due to a use-after-free in onig_new_deluxe() in regext.c of the third-party library Oniguruma 6.9.2 which is used by PHP.
The attacker provides a pair of a regex pattern and a string, with a multi-byte encoding that gets handled by onig_new_deluxe().

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP 'CVE-2019-13224' Use-After-Free Vulnerability - Linux`
OID:1.3.6.1.4.1.25623.1.0.108633
Version used: `2025-09-24T05:39:03Z`

Critical (CVSS: 9.8)
NVT: PHP < 8.1.32, 8.2.x < 8.2.28 Multiple Vulnerabilities - Linux

Product detection result
`cpe:/a:php:php:5.2.4`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     8.1.32
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.1.32, 8.2.28 or later.

Affected Software/OS
PHP versions prior to 8.1.32, and 8.2.x prior to 8.2.28.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2025-1217: Header parser of 'http' stream wrapper does not handle folded headers
- CVE-2025-1219: libxml streams use wrong 'content-type' header when requesting a redirected resource
- CVE-2025-1734: Streams HTTP wrapper does not fail for headers without colon
- CVE-2025-1736: Stream HTTP wrapper header check might omit basic auth header
- CVE-2025-1861: Stream HTTP wrapper truncate redirect location to 1024 bytes

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Product detection result

```
cpe:/a:php:php:5.2.4
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     5.6.40
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 5.6.40, 7.1.16, 7.2.14, 7.3.1 or later.

Affected Software/OS

PHP versions before 5.6.40, 7.x before 7.1.26, 7.2.x before 7.2.14 and 7.3.x before 7.3.1.

Vulnerability Insight

The following flaws exist:

- Fixed bug #77269 (efree() on uninitialized Heap data in imagescale leads to use-after-free). (CVE-2016-10166)
- Fixed bug #77270 (imagecolormatch Out Of Bounds Write on Heap). (CVE-2019-6977)
- Fixed bug #77370 (Buffer overflow on mb regex functions - fetch_token). (CVE-2019-9023)
- Fixed bug #77371 (heap buffer overflow in mb regex functions - compile_string_node). (CVE-2019-9023)
- Fixed bug #77381 (heap buffer overflow in multibyte match_at). (CVE-2019-9023)
- Fixed bug #77382 (heap buffer overflow due to incorrect length in expand_case_fold_string). (CVE-2019-9023)
- Fixed bug #77385 (buffer overflow in fetch_token). (CVE-2019-9023)

. . . continues on next page . . .

. . . continued from previous page . . .

- Fixed bug #77394 (Buffer overflow in multibyte case folding - unicode). (CVE-2019-9023)
- Fixed bug #77418 (Heap overflow in utf32be_mbc_to_code). (CVE-2019-9023)
- Fixed bug #77247 (heap buffer overflow in phar_detect_phar_fname_ext). (CVE-2019-9021)
- Fixed bug #77242 (heap out of bounds read in xmlrpc_decode()). (CVE-2019-9020)
- Fixed bug #77380 (Global out of bounds read in xmlrpc base64 code). (CVE-2019-9024)

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.6)
NVT: PHP < 5.5.22, 5.6.x < 5.6.6 XXE Vulnerability - Linux

Product detection result

```
cpe:/a:php:php:5.2.4
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to an XML external entity (XXE) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     5.5.22
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to conduct XML External Entity (XXE) and XML Entity Expansion (XEE) attacks.

Solution:

Solution type: VendorFix

Update to PHP version 5.5.22, 5.6.6 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
PHP prior to version 5.5.22 and 5.6.x prior to 5.6.6 on Linux.

Vulnerability Insight
The flaw is due to script 'ext/libxml/libxml.c' does not isolate each thread from 'libxml_disable_entity_loader' when PHP-FPM is used.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.22, 5.6.x < 5.6.6 XXE Vulnerability - Linux`
OID:1.3.6.1.4.1.25623.1.0.808615

Product detection result
`cpe:/a:php:php:5.2.4`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to a buffer overflow vulnerability.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     5.2.12
Installation
path / port:       80/tcp
```

Impact

Successful exploitation could allow attackers to potentially compromise a vulnerable system.

Solution:

Solution type: VendorFix

Update to version 5.2.12, 5.3.1 or later.

Affected Software/OS

PHP version 5.2.x through 5.2.11 and 5.3.0.

Vulnerability Insight

The '_gdGetColors' function in gd_gd.c fails to check certain colorsTotal structure member, whicn can be exploited to cause buffer overflow or buffer over-read attacks via a crafted GD file.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `PHP 5.2.x < 5.2.12, 5.3.0 Buffer Overflow Vulnerability`

```
cpe:/a:php:php:5.2.4
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to an out-of-bounds read memory corruption vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     5.5.31
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to obtain sensitive information or cause a denial-of-service condition.

Solution:

Solution type: VendorFix

Update to version 5.5.31, 5.6.17, 7.0.2 or later.

Affected Software/OS

PHP prior to version 5.5.31, 5.6.x prior to 5.6.17 and 7.x prior to 7.0.2 on Linux.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

A memory corruption vulnerability occurs via a large 'bgd_color' argument to the 'imagerotate' function in 'ext/gd/libgd/gd_interpolation.c' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.31, 5.6.x < 5.6.17, 7.x < 7.0.2 Out of Bounds Read Memory Corruption . ↪..`

Installation
path / port:        80/tcp
```

Solution:
Solution type: VendorFix
Update to version 7.2.27, 7.3.14, 7.4.2 or later.

Affected Software/OS
PHP versions before 7.2.27, 7.3.x and 7.4.x.

Vulnerability Insight
PHP is prone to multiple vulnerabilities:
- OOB read in php_strip_tags_ex (CVE-2020-7059)
- Global buffer-overflow in 'mbfl_filt_conv_big5_wchar' (CVE-2020-7060)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 7.2.27, 7.3.x < 7.3.14, 7.4.x < 7.4.2 Multiple Vulnerabilities (Jan 2020).`

Critical (CVSS: 9.1)
NVT: Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux

Product detection result

```
cpe:/a:apache:http_server:2.2.8
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.2.8
Fixed version:     2.2.34
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow remote attackers to cause the target service to crash. A remote user can obtain potentially sensitive information as well on the target system.

Solution:

Solution type: VendorFix

Update to Apache HTTP Server 2.2.34 or 2.4.27 or later.

Affected Software/OS

Apache HTTP Server 2.2.x before 2.2.34 and 2.4.x before 2.4.27.

Vulnerability Insight

The flaw exists due to error in Apache 'mod_auth_digest' which does not properly initialize memory used to process 'Digest' type HTTP Authorization headers.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux`

NVT: PHP < 5.5.31, 5.6.x < 5.6.17, 7.x < 7.0.2 DoS Vulnerability (Aug 2016) - Linux

Product detection result
`cpe:/a:php:php:5.2.4`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     5.5.31
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting this issue allow attackers to obtain sensitive information from process memory or cause a denial of service (out-of-bounds read and buffer overflow) via a long string.

Solution:
Solution type: VendorFix
Update to version 5.5.31, 5.6.17, 7.0.2 or later.

Affected Software/OS
PHP prior to version 5.5.31, 5.6.x prior to 5.6.17 and 7.x prior to 7.0.2 on Linux.

Vulnerability Insight
The flaw is due to the 'sapi/fpm/fpm/fpm_log.c' script misinterprets the semantics of the snprintf return value.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.31, 5.6.x < 5.6.17, 7.x < 7.0.2 DoS Vulnerability (Aug 2016) - Linux`

2.8.3 Critical general/tcp

Critical (CVSS: 10.0)
NVT: Operating System (OS) End of Life (EOL) Detection

Product detection result
```
cpe:/o:canonical:ubuntu_linux:8.04
Detected by OS Detection Consolidation and Reporting (OID: 1.3.6.1.4.1.25623.1.0
↪.105937)
```

. . . continues on next page . . .

. . . continued from previous page . . .

Summary
The Operating System (OS) on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The "Ubuntu" Operating System on the remote host has reached the end of life.
CPE:                cpe:/o:canonical:ubuntu_linux:8.04
Installed version,
build or SP:        8.04
EOL date:           2013-05-09
EOL info:           https://documentation.ubuntu.com/project/release-team/list-of
↪-releases/
```

Impact
An EOL version of an OS is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: Mitigation
Update the OS on the remote host to a version which is still supported and receiving security updates by the vendor.
Note / Important: Please create an override for this result if the target host is a:
- Windows system with Extended Security Updates (ESU)
- System with additional 3rd-party / non-vendor security updates like e.g. from 'TuxCare', 'Freexian Extended LTS' or similar

Vulnerability Detection Method
Checks if an EOL version of an OS is present on the target host.
Details: `Operating System (OS) End of Life (EOL) Detection`
OID:1.3.6.1.4.1.25623.1.0.103674

2.8.4 Critical 22/tcp

Critical (CVSS: 9.8)
NVT: OpenSSH < 7.2 X11 Forwarding Security Bypass Vulnerability - Linux

Product detection result
`cpe:/a:openbsd:openssh:4.7p1`
`Detected by OpenSSH Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.108577)`

Summary
OpenSSH is prone to a security bypass vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 4.7p1
Fixed version:     7.2
Installation
path / port:       22/tcp
```

Impact
Successfully exploiting this issue allows local users to bypass certain security restrictions and perform unauthorized actions. This may lead to further attacks.

Solution:
Solution type: VendorFix
Update to version 7.2 or later.

Affected Software/OS
OpenSSH versions before 7.2 on Linux.

Vulnerability Insight
An access flaw was discovered in OpenSSH, it did not correctly handle failures to generate authentication cookies for untrusted X11 forwarding. A malicious or compromised remote X application could possibly use this flaw to establish a trusted connection to the local X server, even if only untrusted X11 forwarding was requested.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `OpenSSH < 7.2 X11 Forwarding Security Bypass Vulnerability - Linux`

NVT: OpenBSD OpenSSH < 9.3p2 RCE Vulnerability

Product detection result

```
cpe:/a:openbsd:openssh:4.7p1
Detected by OpenSSH Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.108577)
```

Summary

OpenBSD OpenSSH is prone to a remote code execution (RCE) vulnerability in OpenSSH's forwarded ssh-agent.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 4.7p1
Fixed version:     9.3p2
Installation
path / port:       22/tcp
```

Solution:

Solution type: VendorFix

Update to version 9.3p2 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
OpenBSD OpenSSH prior to version 9.3p2.
The following conditions needs to be met:
- Exploitation requires the presence of specific libraries on the victim system.
- Remote exploitation requires that the agent was forwarded to an attacker-controlled system.

Vulnerability Insight
A condition where specific libraries loaded via ssh-agent(1)'s PKCS#11 support could be abused to achieve remote code execution via a forwarded agent socket.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `OpenBSD OpenSSH < 9.3p2 RCE Vulnerability`

2.8.5 Critical 5432/tcp

Critical (CVSS: 10.0)
NVT: PostgreSQL End of Life (EOL) Detection - Linux

Product detection result

```
cpe:/a:postgresql:postgresql:8.3.1
Detected by PostgreSQL Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.12802
↪5)
```

Summary

The PostgreSQL version on the remote host has reached the End of Life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "PostgreSQL" version on the remote host has reached the end of life.
CPE:               cpe:/a:postgresql:postgresql:8.3.1
Installed version: 8.3.1
Location/URL:      5432/tcp
EOL version:       8.3
EOL date:          2013-02-07
```

Impact

An EOL version of PostgreSQL is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:

Solution type: VendorFix

Update the PostgreSQL version on the remote host to a still supported version.

Vulnerability Detection Method

Checks if an EOL version is present on the target host.

Details: PostgreSQL End of Life (EOL) Detection - Linux

NVT: PostgreSQL Multiple Vulnerabilities (May 2015) - Linux

Product detection result
cpe:/a:postgresql:postgresql:8.3.1
Detected by PostgreSQL Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.12802
↪5)

Summary
PostgreSQL is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 8.3.1
Fixed version: See references
Installation
path / port: 5432/tcp

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to version 9.0.20, 9.1.16, 9.2.11, 9.3.7, 9.4.2 or later.

Affected Software/OS
PostgreSQL versions prior to 9.0.20, 9.1.x prior to 9.1.16, 9.2.x prior to 9.2.11, 9.3.x prior to 9.3.7 and 9.4.x prior to 9.4.2.

Vulnerability Insight
The following flaws exist:
- CVE-2015-3165: Double 'free' after authentication timeout
- CVE-2015-3166: Unanticipated errors from the standard library
- CVE-2015-3167: pgcrypto has multiple error messages for decryption with an incorrect key

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PostgreSQL Multiple Vulnerabilities (May 2015) - Linux`

NVT: PostgreSQL < 10.6, 11.x < 11.1 SQL Injection Vulnerability - Linux

Product detection result
`cpe:/a:postgresql:postgresql:8.3.1`

. . . continues on next page . . .

. . . continued from previous page . . .

Detected by PostgreSQL Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.12802
↪5)

Summary
PostgreSQL is prone to an SQL injection vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.3.1
Fixed version:     10.6
Installation
path / port:       5432/tcp
```

Solution:
Solution type: VendorFix
Update to version 10.6 or 11.1 respectively.

Affected Software/OS
PostgreSQL before versions 10.6 and 11.1.

Vulnerability Insight
A SQL Injection flaw has been discovered in PostgreSQL server in the way triggers that enable transition relations are dumped. The transition relation name is not correctly quoted and it may allow an attacker with CREATE privilege on some non-temporary schema or TRIGGER privilege on some table to create a malicious trigger that, when dumped and restored, would result in additional SQL statements being executed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: PostgreSQL < 10.6, 11.x < 11.1 SQL Injection Vulnerability - Linux
OID:1.3.6.1.4.1.25623.1.0.112429

[return to 172.30.1.1]

2.8.6 Critical 512/tcp

Critical (CVSS: 10.0)
NVT: The rexec service is running

Summary

This remote host is running a rexec service.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 80%

Vulnerability Detection Result
`The rexec service was detected on the target system.`

Solution:
Solution type: Mitigation
Disable the rexec service and use alternatives like SSH instead.

Vulnerability Insight
rexec (remote execution client for an exec server) has the same kind of functionality that rsh has: you can execute shell commands on a remote computer.
The main difference is that rexec authenticate by reading the username and password *unencrypted* from the socket.

Vulnerability Detection Method
Checks whether an rexec service is exposed on the target host.
Details: `The rexec service is running`
OID:1.3.6.1.4.1.25623.1.0.100111
Version used: `2023-09-12T05:05:19Z`

2.8.7 Critical 6200/tcp

Critical (CVSS: 9.8)
NVT: vsftpd Compromised Source Packages Backdoor Vulnerability

Summary
vsftpd is prone to a backdoor vulnerability.

Quality of Detection (QoD): 99%

Vulnerability Detection Result
Vulnerability was detected according to the Vulnerability Detection Method.

Impact
Attackers can exploit this issue to execute arbitrary commands in the context of the application. Successful attacks will compromise the affected application.

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
The repaired package can be downloaded from the referenced vendor homepage. Please validate the package with its signature.

Affected Software/OS
The vsftpd 2.3.4 source package downloaded between 20110630 and 20110703 is affected.

Vulnerability Insight
The tainted source package contains a backdoor which opens a shell on port 6200/tcp.

Vulnerability Detection Method
Details: `vsftpd Compromised Source Packages Backdoor Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.103185
Version used: `2023-12-07T05:05:41Z`

2.8.8 Critical 1524/tcp

Critical (CVSS: 10.0)
NVT: Possible Backdoor: Ingreslock

Summary
A backdoor is installed on the remote host.

Quality of Detection (QoD): 99%

Vulnerability Detection Result
`The service is answering to an 'id;' command with the following response: uid=0(`
`↪root) gid=0(root)`

Impact
Attackers can exploit this issue to execute arbitrary commands in the context of the application. Successful attacks will compromise the affected isystem.

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: Workaround
A whole cleanup of the infected system is recommended.

Vulnerability Detection Method
Details: `Possible Backdoor: Ingreslock`
OID:1.3.6.1.4.1.25623.1.0.103549
Version used: `2023-07-25T05:05:58Z`

[return to 172.30.1.1]

2.8.9 Critical 445/tcp

Critical (CVSS: 10.0)
NVT: Samba 3.0.0 <= 3.6.3 Remote Code Execution Vulnerability (CVE-2012-1182)

Product detection result
`cpe:/a:samba:samba:3.0.20`
`Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)`

Summary
Samba 3.0.x to 3.6.3 are affected by a vulnerability that allows remote code execution (RCE) as the 'root' user.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.0.20
Fixed version:     3.4.16
Installation
path / port:       445/tcp
```

Solution:
Solution type: VendorFix
Update to version 3.4.16, 3.5.14, 3.6.4 or later.

Affected Software/OS
Samba versions 3.0.0 through 3.6.3.

Vulnerability Insight
Samba versions 3.6.3 and all versions previous to this are affected by a vulnerability that allows remote code execution as the 'root' user from an anonymous connection.

. . . continues on next page . . .

. . . continued from previous page . . .

The code generator for Samba's remote procedure call (RPC) code contained an error which caused it to generate code containing a security flaw. This generated code is used in the parts of Samba that control marshalling and unmarshalling of RPC calls over the network.
The flaw caused checks on the variable containing the length of an allocated array to be done independently from the checks on the variable used to allocate the memory for that array. As both these variables are controlled by the connecting client it makes it possible for a specially crafted RPC call to cause the server to execute arbitrary code.
As this does not require an authenticated connection it is the most serious vulnerability possible in a program, and users and vendors are encouraged to patch their Samba installations immediately.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Samba 3.0.0 <= 3.6.3 Remote Code Execution Vulnerability (CVE-2012-1182)`
OID:1.3.6.1.4.1.25623.1.0.150729

Critical (CVSS: 10.0)
NVT: Samba End of Life (EOL) Detection

Product detection result
cpe:/a:samba:samba:3.0.20
Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)

Summary
The Samba version on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "Samba" version on the remote host has reached the end of life.
CPE:                cpe:/a:samba:samba:3.0.20
Installed version:  3.0.20
Location/URL:       445/tcp
EOL version:        3.0
EOL date:           2009-08-05
```

Impact
An EOL version of Samba is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: VendorFix
Update the Samba version on the remote host to a still supported version.

Vulnerability Detection Method
Checks if an EOL version is present on the target host.
Details: Samba End of Life (EOL) Detection
OID:1.3.6.1.4.1.25623.1.0.140159
Version used: 2025-04-15T05:54:49Z

Product Detection Result

url: https://wiki.samba.org/index.php/Samba_Release_Planning

Critical (CVSS: 10.0)
NVT: Samba 3.0.0 <= 3.0.25rc3 Remote Code Execution Vulnerability (CVE-2007-2446)

Product detection result
`cpe:/a:samba:samba:3.0.20`
`Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)`

Summary
Multiple Heap Overflows Allow remote code execution (RCE).

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.0.20
Fixed version:     Apply patch
Installation
path / port:       445/tcp
```

Solution:
Solution type: VendorFix
Apply the patch mentioned in the linked reference.

Affected Software/OS
Samba versions 3.0.0 through 3.0.25rc3.

Vulnerability Insight
Various bugs in Samba's NDR parsing can allow a user to send specially crafted MS-RPC requests that will overwrite the heap space with user defined data.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Samba 3.0.0 <= 3.0.25rc3 Remote Code Execution Vulnerability (CVE-2007-2446)`
OID:1.3.6.1.4.1.25623.1.0.150725
Version used: `2024-06-28T15:38:46Z`

Product Detection Result
Product: `cpe:/a:samba:samba:3.0.20`
Method: `SMB NativeLanMan`
OID: 1.3.6.1.4.1.25623.1.0.102011)

References
`cve: CVE-2007-2446`

Critical (CVSS: 10.0)
NVT: Samba 'TALLOC_FREE()' Function RCE Vulnerability

Product detection result
`cpe:/a:samba:samba:3.0.20`
`Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)`

Summary
Samba is prone to a remote code execution (RCE) vulnerability in the 'TALLOC_FREE()' function.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.0.20
Fixed version:     3.6.25 or 4.0.25 or 4.1.17, 4.2.0rc5, or later
Installation
path / port:       445/tcp
```

Impact
An attacker can exploit this issue to execute arbitrary code with root privileges. Failed exploit attempts will cause a denial-of-service condition

Solution:
Solution type: VendorFix
Updates are available. Please see the references or vendor advisory for more information.

Affected Software/OS
Samba 3.5.x and 3.6.x before 3.6.25, 4.0.x before 4.0.25, 4.1.x before 4.1.17, and 4.2.x before 4.2.0rc5

Vulnerability Insight
The Netlogon server implementation in smbd performs a free operation on an uninitialized stack pointer, which allows remote attackers to execute arbitrary code via crafted Netlogon packets that use the ServerPasswordSet RPC API, as demonstrated by packets reaching the _netr_ServerPasswordSet function in rpc_server/netlogon/srv_netlog_nt.c.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Samba 'TALLOC_FREE()' Function RCE Vulnerability`

Product detection result

```
cpe:/a:samba:samba:3.0.20
Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)
```

Summary

Samba is prone to an elevation of privilege vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.0.20
Fixed version:     4.15.13 / 4.16.0
Installation
path / port:       445/tcp
```

Solution:
Solution type: VendorFix
Update to version 4.15.13, 4.16.0 or later.

Affected Software/OS

Samba versions prior to 4.15.13.

Vulnerability Insight

Kerberos, the trusted third party authentication system at the heart of Active Directory, issues a ticket using a key known to the target server but nobody else, returned to the client in a TGS-REP.

. . . continues on next page . . .

. . . continued from previous page . . .

This key needs to be of a type understood only by the KDC and target server.
However, due to a coding error subsequently addressed in all recent Heimdal versions and so fixed with Samba 4.16 (which imports Heimdal 8.0pre), the (attacking) client would be given the opportunity to select the encryption type, and so obtain a ticket encrypted with rc4-hmac, that it could attack offline.
This is possible unless rc4-hmac is totally removed from the server's account, by removing the unicodePwd attribute, but this will break other aspects of the server's operation in the domain (NETLOGON in particular).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Samba Elevation of Privilege Vulnerability (CVE-2022-45141)`

Critical (CVSS: 9.3)
NVT: MySQL 5.x Unspecified Buffer Overflow Vulnerability

Product detection result
`cpe:/a:mysql:mysql:5.0.51a`
`Detected by MariaDB / Oracle MySQL Detection (MySQL Protocol) (OID: 1.3.6.1.4.1.`
`↪25623.1.0.100152)`

Summary
MySQL is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
`Installed version: 5.0.51a`
`Fixed version:  Unknown`

Impact
An attacker can leverage this issue to execute arbitrary code within the context of the vulnerable application. Failed exploit attempts will result in a denial-of-service condition.

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
This issue affects MySQL 5.x. Other versions may also be vulnerable.

Vulnerability Insight
The flaw exists because the application fails to perform adequate boundary checks on user-supplied data.

2.8.11 Critical 513/tcp

Critical (CVSS: 10.0)
NVT: rlogin Passwordless Login

Summary
The rlogin service allows root access without a password.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
`It was possible to gain root access without a password.`

Impact
This vulnerability allows an attacker to gain complete control over the target system.

Solution:
Solution type: Mitigation
Disable the rlogin service and use alternatives like SSH instead.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `rlogin Passwordless Login`
OID:1.3.6.1.4.1.25623.1.0.113766
Version used: `2020-09-30T09:30:12Z`

[return to 172.30.1.1]

2.8.12 High 80/tcp

High (CVSS: 8.8)
NVT: phpMyAdmin <= 5.1.1 CSV Injection Vulnerability - Linux

Summary
phpMyAdmin is prone to a CSV injection vulnerability via Export Section.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

. . . continues on next page . . .

. . . continued from previous page . . .

```
Installed version: 3.1.1
Fixed version:     None
Installation
path / port:       /phpMyAdmin
```

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
phpMyAdmin version 5.1.1 and prior.

Vulnerability Insight
NOTE: the vendor disputes this because 'the CSV file is accurately generated based on the database contents.'
Nevertheless the vendor could implement measures while doing the CSV export which could lower or mitigate the risk originating from this flaw.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `phpMyAdmin <= 5.1.1 CSV Injection Vulnerability - Linux`
OID:1.3.6.1.4.1.25623.1.0.144898

Product detection result
`cpe:/a:php:php:5.2.4`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

. . . continues on next page . . .

. . . continued from previous page . . .

```
Installed version: 5.2.4
Fixed version:     8.1.30
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.1.30, 8.2.24, 8.3.12 or later.

Affected Software/OS
PHP versions prior to 8.1.30, 8.2.x prior to 8.2.24 and 8.3.x prior to 8.3.12.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2024-8925, CVE-2024-8928: Erroneous parsing of multipart form data
- CVE-2024-8926: Bypass of CVE-2024-4577, Parameter Injection Vulnerability
- CVE-2024-8927: cgi.force_redirect configuration is bypassable due to the environment variable collision
- CVE-2024-9026: Logs from children may be altered

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Product detection result

```
cpe:/a:php:php:5.2.4
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     5.6.36
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow an attacker to conduct XSS attacks, crash PHP, conduct denial of service condition and execute arbitrary code in the context of the affected application.

Solution:

Solution type: VendorFix

Update to version 5.6.36, 7.0.30, 7.1.17, 7.2.5 or later.

Affected Software/OS

. . . continues on next page . . .

. . . continued from previous page . . .

PHP prior to version 5.6.36, 7.0.x prior to 7.0.30, 7.1.x prior to 7.1.17 and 7.2.x prior to 7.2.5 on Linux.

Vulnerability Insight
The following flaws exist:
- CVE-2018-10549: Out of bounds read error in 'exif_read_data' function while processing crafted JPG data.
- CVE-2018-10546: An error in stream filter 'convert.iconv' which leads to infinite loop on invalid sequence.
- CVE-2018-10548: An error in the LDAP module of PHP which allows a malicious LDAP server or man-in-the-middle attacker to crash PHP.
- CVE-2018-10547: An error in the 'phar_do_404()' function in 'ext/phar/phar_object.c' script which returns parts of the request unfiltered, leading to another XSS vector. This is due to incomplete fix for CVE-2018-5712.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.36, 7.x < 7.0.30, 7.1.x < 7.1.17, 7.2.x < 7.2.5 Multiple Vulnerabilit.`

High (CVSS: 8.8)
NVT: phpMyAdmin < 4.9.4, 5.x < 5.0.1 SQL Injection Vulnerability (PMASA-2020-1) - Linux

Summary
phpMyAdmin is prone to an SQL injection vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.1.1
Fixed version:     4.9.4
Installation
path / port:       /phpMyAdmin
```

Impact
A malicious user could inject custom SQL in place of their own username when creating queries to this page. An attacker must have a valid MySQL account to access the server.

Solution:
Solution type: VendorFix
Update to version 4.9.4, 5.0.1 or later.

Affected Software/OS
phpMyAdmin prior to version 4.9.4 and 5.x prior to 5.0.1.

Vulnerability Insight
An SQL injection flaw has been discovered in the user accounts page.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `phpMyAdmin < 4.9.4, 5.x < 5.0.1 SQL Injection Vulnerability (PMASA-2020-1) - Li.`

Vulnerability Detection Result

```
Installed version: 5.2.4
Fixed version:     5.5.36
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to cause a denial of service (out-of-bounds read) or possibly have unspecified other impact.

Solution:

Solution type: VendorFix

Update to version 5.5.36, 5.6.22, 7.0.7 or later.

Affected Software/OS

PHP prior to version 5.5.36, 5.6.x prior to 5.6.22 and 7.x prior to 7.0.7 on Linux.

Vulnerability Insight

The following flaws exist:

- The 'get_icu_value_internal' function in 'ext/intl/locale/locale_methods.c' script does not ensure the presence of a '\0' character.

- The 'gd_interpolation.c' script in the GD Graphics Library mishandled by the imagescale function.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

```

Solution:
Solution type: VendorFix
Update to version 8.2.30, 8.3.29, 8.4.16 or later.

Affected Software/OS
PHP versions prior to 8.2.30, 8.3.x prior to 8.3.29 and 8.4.x prior to 8.4.16.

Vulnerability Insight
The following flaws exist:
- CVE-2025-14177: Information leak of memory in getimagesize
- CVE-2025-14178: Heap buffer overflow in array_merge()
- CVE-2025-14180: PDO quoting result null deref
- No CVE: Null byte termination in dns_get_record()

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 8.2.30, 8.3.x < 8.3.29, 8.4.x < 8.4.16 Multiple Vulnerabilities - Linux`

2.8.13 High 22/tcp

High (CVSS: 8.5)
NVT: OpenSSH Multiple Vulnerabilities

Product detection result
cpe:/a:openbsd:openssh:4.7p1
Detected by OpenSSH Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.108577)

Summary
OpenSSH is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 4.7p1
Fixed version: 7.0
Installation
path / port: 22/tcp

Impact
Successful exploitation will allow an attacker to gain privileges, to conduct impersonation attacks, to conduct brute-force attacks or cause a denial of service.

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Upgrade to OpenSSH 7.0 or later.

Affected Software/OS
OpenSSH versions before 7.0.

Vulnerability Insight
Multiple flaws are due to:
- Use-after-free vulnerability in the 'mm_answer_pam_free_ctx' function in monitor.c in sshd.
- Vulnerability in 'kbdint_next_device' function in auth2-chall.c in sshd.
- Vulnerability in the handler for the MONITOR_REQ_PAM_FREE_CTX request.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

High (CVSS: 8.8)
NVT: PostgreSQL Multiple Vulnerabilities (Mar 2015) - Linux

Product detection result

```
cpe:/a:postgresql:postgresql:8.3.1
Detected by PostgreSQL Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.12802
↪5)
```

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

PostgreSQL is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.3.1
Fixed version:     9.1.20
Installation
path / port:       5432/tcp
```

Impact

Successful exploitation will allow a remote attacker to escalate privileges and to cause denial of service conditions.

Solution:

Solution type: VendorFix

Upgrade to version 9.1.20 or 9.2.15 or 9.3.11 or 9.4.6 or 9.5.1 or later.

Affected Software/OS

PostgreSQL version before 9.1.20, 9.2.x before 9.2.15, 9.3.x before 9.3.11, 9.4.x before 9.4.6, and 9.5.x before 9.5.1.

Vulnerability Insight

Multiple flaws are due to the PostgreSQL incorrectly handle certain regular expressions and certain configuration settings (GUCS) for users of PL/Java.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

2.8.15 High 445/tcp

High (CVSS: 8.8)
NVT: Samba RCE Vulnerability (CVE-2021-44142)

Product detection result
`cpe:/a:samba:samba:3.0.20`
`Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)`

Summary
Samba is prone to a remote code execution (RCE) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.0.20
Fixed version:     4.13.17
Installation
path / port:       445/tcp
```

Solution:
Solution type: VendorFix
Update to version 4.13.17, 4.14.12, 4.15.5 or later.

Affected Software/OS
Samba versions prior to 4.13.17, version 4.14.x through 4.14.11 and 4.15.x through 4.15.4.

Vulnerability Insight
Samba is vulnerable to an out-of-bounds heap read write vulnerability that allows remote attackers to execute arbitrary code as root on affected Samba installations that use the VFS module vfs_fruit.
The specific flaw exists within the parsing of EA metadata when opening files in smbd. Access as a user that has write access to a file's extended attributes is required to exploit this vulnerability. Note that this could be a guest or unauthenticated user if such users are allowed write access to file extended attributes.
The problem in vfs_fruit exists in the default configuration of the fruit VFS module using fruit:metadata=netatalk or fruit:resource=file. If both options are set to different settings than the default values, the system is not affected by the security issue.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Samba RCE Vulnerability (CVE-2021-44142)`

NVT: Samba Buffer Overflow Vulnerability (CVE-2022-42898)

Product detection result
`cpe:/a:samba:samba:3.0.20`
`Detected by SMB NativeLanMan (OID: 1.3.6.1.4.1.25623.1.0.102011)`

Summary
Samba is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.0.20
Fixed version:     4.15.12 / 4.16.7 / 4.17.3
Installation
path / port:       445/tcp
```

Solution:
Solution type: VendorFix
Update to version 4.15.12, 4.16.7, 4.17.3 or later.

Affected Software/OS
Samba versions prior to 4.15.12, 4.16.x prior to 4.16.7 and 4.17.x prior to 4.17.3 on 32-bit systems.

Vulnerability Insight
Samba's Kerberos libraries and AD DC failed to guard against integer overflows when parsing a PAC on a 32-bit system, which allowed an attacker with a forged PAC to corrupt the heap.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Samba versions prior to 4.14.14, 4.15.x prior to 4.15.9 and 4.16.x prior to 4.16.4.

Vulnerability Insight
The following flaws exist:
- CVE-2022-2031: Samba AD users can bypass certain restrictions associated with changing passwords
- CVE-2022-32742: Server memory information leak via SMB1
- CVE-2022-32746: Samba AD users can induce a use-after-free in the server process with an LDAP add or modify request

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

2.8.16 High 3306/tcp

High (CVSS: 8.5)
NVT: MySQL 'sql_parse.cc' Multiple Format String Vulnerabilities

Product detection result
`cpe:/a:mysql:mysql:5.0.51a`
`Detected by MariaDB / Oracle MySQL Detection (MySQL Protocol) (OID: 1.3.6.1.4.1.`
`↪25623.1.0.100152)`

Summary
MySQL is prone to Multiple Format String vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
`Installed version: 5.0.51a`
`Vulnerable range:  4.0 - 5.0.83`

Impact
Successful exploitation could allow remote authenticated users to cause a Denial of Service and possibly have unspecified other attacks.

Solution:
Solution type: VendorFix
Upgrade to MySQL version 5.1.36 or later.

Affected Software/OS
MySQL version 4.0.0 to 5.0.83 on all running platform.

Vulnerability Insight
The flaws are due to error in the 'dispatch_command' function in sql_parse.cc in libmysqld/ which can caused via format string specifiers in a database name in a 'COM_CREATE_DB' or 'COM_DROP_DB' request.

Vulnerability Detection Method
Details: `MySQL 'sql_parse.cc' Multiple Format String Vulnerabilities`

Summary
phpMyAdmin is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Installed version: 4.6.6
Fixed version:     4.9.6
Installation
path / port:       /
```

Impact

Successful exploitation would allow an attacker to:
- If an attacker sends a crafted link to the victim with the malicious JavaScript, when the victim clicks on the link, the JavaScript will run and complete the instructions made by the attacker (CVE-2020-26934)
- An attacker could use this flaw to inject malicious SQL in to a query (CVE-2020-26935)

Solution:

Solution type: VendorFix

Update to version 4.9.6, 5.0.3 or later.

Affected Software/OS

phpMyAdmin prior to version 4.9.6 and 5.x prior to 5.0.3.

Vulnerability Insight

The following vulnerabilities exist:
- XSS relating to the transformation feature (CVE-2020-26934)
- SQL injection vulnerability in SearchController (CVE-2020-26935)

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `phpMyAdmin < 4.9.6, 5.x < 5.0.3 Multiple Vulnerabilities (PMASA-2020-5, PMASA-2.`

2.9.2 High 80/tcp

High (CVSS: 8.8)
NVT: phpMyAdmin <= 5.1.1 CSV Injection Vulnerability - Linux

Summary
phpMyAdmin is prone to a CSV injection vulnerability via Export Section.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 4.6.6
Fixed version:     None
Installation
path / port:       /
```

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
phpMyAdmin version 5.1.1 and prior.

Vulnerability Insight
NOTE: the vendor disputes this because 'the CSV file is accurately generated based on the database contents.'
Nevertheless the vendor could implement measures while doing the CSV export which could lower or mitigate the risk originating from this flaw.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `phpMyAdmin <= 5.1.1 CSV Injection Vulnerability - Linux`

Fixed version:      10.6
Installation
path / port:        5432/tcp
```

Solution:
Solution type: VendorFix
Update to version 10.6 or 11.1 respectively.

Affected Software/OS
PostgreSQL before versions 10.6 and 11.1.

Vulnerability Insight
A SQL Injection flaw has been discovered in PostgreSQL server in the way triggers that enable transition relations are dumped. The transition relation name is not correctly quoted and it may allow an attacker with CREATE privilege on some non-temporary schema or TRIGGER privilege on some table to create a malicious trigger that, when dumped and restored, would result in additional SQL statements being executed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PostgreSQL < 10.6, 11.x < 11.1 SQL Injection Vulnerability - Linux`
OID:1.3.6.1.4.1.25623.1.0.112429

NVT: Elasticsearch End of Life (EOL) Detection

Summary
The Elasticsearch version on the remote host has reached the End of Life (EOL) and should not be used anymore.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The "Elasticsearch" version on the remote host has reached the end of life.
CPE:                cpe:/a:elastic:elasticsearch:2.4.6
Installed version: 2.4.6
EOL version:        2.4
EOL date:           2018-02-28
```

Impact

An EOL version of Elasticsearch is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:

Solution type: VendorFix

Update Elasticsearch to a version that still receives technical support and updates.

Vulnerability Detection Method

Checks if an EOL version is present on the target host.

Details: `Elasticsearch End of Life (EOL) Detection`

OID:1.3.6.1.4.1.25623.1.0.113131

Version used: `2025-09-03T08:26:15Z`

High (CVSS: 8.8)

NVT: Elastic Elasticsearch 'CVE-2018-3831' Information Disclosure Vulnerability - Linux

Summary

Elasticsearch is prone to an information disclosure vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.6
Fixed version:     5.6.12
```

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

Successful exploitation would allow an authenticated attacker to acquire valid login credentials.

Solution:
Solution type: VendorFix
Update to version 5.6.12 or 6.4.1 respectively.

Affected Software/OS
Elasticsearch versions through 5.6.11 and 6.0.0 through 6.4.0.

Vulnerability Insight
The _cluster/settings API, when queried, could leak sensitive configuration information such as passwords, tokens or usernames.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Elastic Elasticsearch 'CVE-2018-3831' Information Disclosure Vulnerability - Li.`

Product detection result
`cpe:/a:apache:http_server:2.4.25`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.26
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow remote attackers to bypass authentication and perform unauthorized actions, cause a denial-of-service condition and gain access to potentially sensitive information.

Solution:
Solution type: VendorFix
Update to Apache HTTP Server 2.2.33 or 2.4.26 or later.

Affected Software/OS
Apache HTTP Server 2.2.x before 2.2.33 and 2.4.x before 2.4.26.

Vulnerability Insight
Multiple flaws exist as,
- The mod_mime can read one byte past the end of a buffer when sending a malicious Content-Type response header.
- The mod_ssl may dereference a NULL pointer when third-party modules call ap_hook_process_connection() during an HTTP request to an HTTPS port.
- An use of the ap_get_basic_auth_pw() by third-party modules outside of the authentication phase may lead to authentication requirements being bypassed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: Apache HTTP Server 2.4.0 - 2.4.46 Multiple Vulnerabilities - Linux

Product detection result
`cpe:/a:apache:http_server:2.4.25`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.48
Installation
path / port:       80/tcp
```

Impact
- CVE-2020-35452: A specially crafted Digest nonce can cause a stack overflow in mod_auth_digest.
- CVE-2021-26690: A specially crafted Cookie header handled by mod_session can cause a NULL pointer dereference and crash, leading to a possible Denial Of Service.
- CVE-2021-26691: A specially crafted SessionHeader sent by an origin server could cause a heap overflow.

Solution:
Solution type: VendorFix
Update to version 2.4.48 or later.

Affected Software/OS
Apache HTTP Server versions 2.4.0 to 2.4.46 on Linux.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2020-35452: mod_auth_digest possible stack overflow by one null byte
- CVE-2021-26690: mod_session NULL pointer dereference
- CVE-2021-26691: mod_session response handling heap overflow

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.30
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow an attacker to replay HTTP requests across servers without detection, influence the user content, upload a malicious file, crash the Apache HTTP Server and perform denial of service attack.

Solution:

Solution type: VendorFix

Update to version 2.4.30 or later. Please see the references for more information.

Affected Software/OS

Apache HTTP Server versions from 2.4.1 to 2.4.4, 2.4.6, 2.4.7, 2.4.9, 2.4.10, 2.4.12, 2.4.16 to 2.4.18, 2.4.20, 2.4.23, 2.4.25 to 2.4.29.

Vulnerability Insight

Multiple flaws exist due to:
- Apache HTTP Server fails to correctly generate the nonce sent to prevent reply attacks.
- Misconfigured mod_session variable, HTTP_SESSION.
- Apache HTTP Server fails to sanitize the expression specified in '<FilesMatch>'.
- An error in Apache HTTP Server 'mod_authnz_ldap' when configured with AuthLDAPCharsetConfig.
- Apache HTTP Server fails to sanitize against a specially crafted request.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Product detection result

```
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a HTTP request smuggling vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.56
Installation
path / port:       80/tcp
```

Impact

Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

Solution:

Solution type: VendorFix

Update to version 2.4.56 or later.

Affected Software/OS

Apache HTTP Server versions 2.4.0 through 2.4.55.

Vulnerability Insight

Some mod_proxy configurations allow a HTTP Request Smuggling attack.
Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Vulnerability Detection Method

. . . continues on next page . . .

. . . continued from previous page . . .

Checks if a vulnerable version is present on the target host.

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.27
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow remote attackers to cause the target service to crash. A remote user can obtain potentially sensitive information as well on the target system.

Solution:

Solution type: VendorFix

Update to Apache HTTP Server 2.2.34 or 2.4.27 or later.

Affected Software/OS

Apache HTTP Server 2.2.x before 2.2.34 and 2.4.x before 2.4.27.

Vulnerability Insight

The flaw exists due to error in Apache 'mod_auth_digest' which does not properly initialize memory used to process 'Digest' type HTTP Authorization headers.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux`

Critical (CVSS: 9.1)
NVT: Apache HTTP Server Memory Access Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a memory access vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.41
Installation
```

. . . continues on next page . . .

. . . continued from previous page . . .

path / port: 80/tcp

Solution:
Solution type: VendorFix
Update to version 2.4.41 or later.

Affected Software/OS
Apache HTTP Server version 2.4.18 to 2.4.39.

Vulnerability Insight
Using fuzzed network input, the http/2 session handling could be made to read memory after being freed during connection shutdown.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: Apache HTTP Server Memory Access Vulnerability - Linux
OID:1.3.6.1.4.1.25623.1.0.114149

. . . continued from previous page . . .

↪.0.117232)

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.55
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.55 or later.

Affected Software/OS
Apache HTTP Server version 2.4.54 and prior.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2006-20001: mod_dav out of bounds read, or write of zero byte
- CVE-2022-36760: Possible request smuggling in mod_proxy_ajp
- CVE-2022-37436: mod_proxy allows a backend to trigger HTTP response splitting

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

An EOL version of an OS is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: Mitigation
Update the OS on the remote host to a version which is still supported and receiving security updates by the vendor.
Note / Important: Please create an override for this result if the target host is a:
- Windows system with Extended Security Updates (ESU)
- System with additional 3rd-party / non-vendor security updates like e.g. from 'TuxCare', 'Freexian Extended LTS' or similar

Vulnerability Detection Method
Checks if an EOL version of an OS is present on the target host.
Details: `Operating System (OS) End of Life (EOL) Detection`
OID:1.3.6.1.4.1.25623.1.0.103674

2.13.3 High 80/tcp

High (CVSS: 8.2)
NVT: Apache HTTP Server 2.4.7 - 2.4.51 Multiple Vulnerabilities - Linux

Product detection result
`cpe:/a:apache:http_server:2.4.25`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 2.4.25
Fixed version:     2.4.52
Installation
```

. . . continues on next page . . .

. . . continued from previous page . . .

path / port: 80/tcp

Solution:
Solution type: VendorFix
Update to version 2.4.52 or later.

Affected Software/OS
Apache HTTP Server version 2.4.7 through 2.4.51.

Vulnerability Insight
A crafted URI sent to httpd configured as a forward proxy (ProxyRequests on) can cause a crash (NULL pointer dereference) or, for configurations mixing forward and reverse proxy declarations, can allow for requests to be directed to a declared Unix Domain Socket endpoint (Server Side Request Forgery).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: Apache HTTP Server 2.4.7 - 2.4.51 Multiple Vulnerabilities - Linux

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

This issue may be exploited by a remote attacker to e.g. gain access to sensitive information or modify system configuration.

Solution:
Solution type: Mitigation
Change the password as soon as possible.

Vulnerability Insight
As the VT 'HTTP Brute Force Logins With Default Credentials' (OID: 1.3.6.1.4.1.25623.1.0.108041) might run into a timeout the actual reporting of this vulnerability takes place in this VT instead.

Vulnerability Detection Method
Reports default credentials detected by the VT 'HTTP Brute Force Logins With Default Credentials' (OID: 1.3.6.1.4.1.25623.1.0.108041).
Details: `HTTP Brute Force Logins With Default Credentials Reporting`
OID:1.3.6.1.4.1.25623.1.0.103240
Version used: `2025-05-23T15:42:02Z`

Critical (CVSS: 9.8)
NVT: Eclipse Jetty Server Fake Pipeline Request Security Bypass Vulnerability - Linux

Product detection result
`cpe:/a:eclipse:jetty:9.2.13.20150730`
`Detected by Mort Bay / Eclipse Jetty Detection (HTTP) (OID: 1.3.6.1.4.1.25623.1.`
`↪0.800953)`

Summary
Eclipse Jetty Server is prone to a security bypass vulnerability.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 9.2.13.20150730
Fixed version:     9.2.25.v20180606
Installation
path / port:       8161/tcp
```

Impact

Successful exploitation will allow an attacker to bypass authorization.

Solution:

Solution type: VendorFix

Upgrade to Eclipse Jetty Server version 9.2.25.v20180606 or 9.3.24.v20180605 or 9.4.11.v20180605 or later as per the series. Please see the references for more information.

Affected Software/OS

Eclipse Jetty Server versions 9.2.x before 9.2.25.v20180606, 9.3.x before 9.3.24.v20180605 and 9.4.x before 9.4.11.v20180605.

Vulnerability Insight

The flaw exists due to an improper validation against pipelined requests.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `Eclipse Jetty Server Fake Pipeline Request Security Bypass Vulnerability - Linux`

OID:1.3.6.1.4.1.25623.1.0.813551

Version used: `2024-06-11T05:05:40Z`

Product Detection Result

Product: `cpe:/a:eclipse:jetty:9.2.13.20150730`

Method: `Mort Bay / Eclipse Jetty Detection (HTTP)`

OID: 1.3.6.1.4.1.25623.1.0.800953)

```

Impact
This issue may be exploited by a remote attacker to e.g. gain access to sensitive information or modify system configuration.

Solution:
Solution type: Mitigation
Change the password as soon as possible.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
As the VT 'HTTP Brute Force Logins With Default Credentials' (OID: 1.3.6.1.4.1.25623.1.0.108041) might run into a timeout the actual reporting of this vulnerability takes place in this VT instead.

Vulnerability Detection Method
Reports default credentials detected by the VT 'HTTP Brute Force Logins With Default Credentials' (OID: 1.3.6.1.4.1.25623.1.0.108041).
Details: `HTTP Brute Force Logins With Default Credentials Reporting`
OID:1.3.6.1.4.1.25623.1.0.103240
Version used: `2025-05-23T15:42:02Z`

80/tcp	High

2.15.1 Critical 80/tcp

Critical (CVSS: 9.8)
NVT: Apache HTTP Server Multiple Vulnerabilities (Jun 2017) - Linux

Product detection result
`cpe:/a:apache:http_server:2.4.25`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.26
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow remote attackers to bypass authentication and perform unauthorized actions, cause a denial-of-service condition and gain access to potentially sensitive information.

Solution:
Solution type: VendorFix
Update to Apache HTTP Server 2.2.33 or 2.4.26 or later.

Affected Software/OS
Apache HTTP Server 2.2.x before 2.2.33 and 2.4.x before 2.4.26.

Vulnerability Insight
Multiple flaws exist as,
- The mod_mime can read one byte past the end of a buffer when sending a malicious Content-Type response header.
- The mod_ssl may dereference a NULL pointer when third-party modules call ap_hook_process_connection() during an HTTP request to an HTTPS port.
- An use of the ap_get_basic_auth_pw() by third-party modules outside of the authentication phase may lead to authentication requirements being bypassed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server Multiple Vulnerabilities (Jun 2017) - Linux`

Critical (CVSS: 9.8)
NVT: Apache HTTP Server <= 2.4.52 Multiple Vulnerabilities - Linux

Product detection result
`cpe:/a:apache:http_server:2.4.25`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.53
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.53 or later.

Affected Software/OS
Apache HTTP Server version 2.4.52 and prior.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2022-22719: mod_lua Use of uninitialized value of in r:parsebody
- CVE-2022-22720: HTTP request smuggling vulnerability
- CVE-2022-22721: Possible buffer overflow with very large or unlimited LimitXMLRequestBody
- CVE-2022-23943: mod_sed: Read/write beyond bounds

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server <= 2.4.52 Multiple Vulnerabilities - Linux`
OID:1.3.6.1.4.1.25623.1.0.113837
Version used: `2022-03-21T03:03:41Z`

Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.30
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow an attacker to replay HTTP requests across servers without detection, influence the user content, upload a malicious file, crash the Apache HTTP Server and perform denial of service attack.

Solution:

Solution type: VendorFix

Update to version 2.4.30 or later. Please see the references for more information.

Affected Software/OS

Apache HTTP Server versions from 2.4.1 to 2.4.4, 2.4.6, 2.4.7, 2.4.9, 2.4.10, 2.4.12, 2.4.16 to 2.4.18, 2.4.20, 2.4.23, 2.4.25 to 2.4.29.

Vulnerability Insight

Multiple flaws exist due to:
- Apache HTTP Server fails to correctly generate the nonce sent to prevent reply attacks.
- Misconfigured mod_session variable, HTTP_SESSION.
- Apache HTTP Server fails to sanitize the expression specified in '<FilesMatch>'.
- An error in Apache HTTP Server 'mod_authnz_ldap' when configured with AuthLDAPCharsetConfig.
- Apache HTTP Server fails to sanitize against a specially crafted request.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server Multiple Vulnerabilities (Apr 2018) - Linux`

Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.52
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 2.4.52 or later.

Affected Software/OS

Apache HTTP Server versions through 2.4.51.

Vulnerability Insight

A carefully crafted request body can cause a buffer overflow in the mod_lua multipart parser (r:parsebody() called from Lua scripts).

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a HTTP request smuggling vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.56
Installation
path / port:       80/tcp
```

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

Solution:
Solution type: VendorFix
Update to version 2.4.56 or later.

Affected Software/OS
Apache HTTP Server versions 2.4.0 through 2.4.55.

Vulnerability Insight
Some mod_proxy configurations allow a HTTP Request Smuggling attack.
Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux`

NVT: Apache HTTP Server Memory Access Vulnerability - Linux

Product detection result
`cpe:/a:apache:http_server:2.4.25`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to a memory access vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.41
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.41 or later.

Affected Software/OS
Apache HTTP Server version 2.4.18 to 2.4.39.

Vulnerability Insight
Using fuzzed network input, the http/2 session handling could be made to read memory after being freed during connection shutdown.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server Memory Access Vulnerability - Linux`

NVT: Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.27
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow remote attackers to cause the target service to crash. A remote user can obtain potentially sensitive information as well on the target system.

Solution:

Solution type: VendorFix

Update to Apache HTTP Server 2.2.34 or 2.4.27 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
Apache HTTP Server 2.2.x before 2.2.34 and 2.4.x before 2.4.27.

Vulnerability Insight
The flaw exists due to error in Apache 'mod_auth_digest' which does not properly initialize memory used to process 'Digest' type HTTP Authorization headers.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux`

[return to 172.31.1.92]

2.15.2 Critical general/tcp

Critical (CVSS: 10.0)
NVT: Operating System (OS) End of Life (EOL) Detection

Product detection result
```
cpe:/o:debian:debian_linux:9
Detected by OS Detection Consolidation and Reporting (OID: 1.3.6.1.4.1.25623.1.0
↪.105937)
```

. . . continues on next page . . .

. . . continued from previous page . . .

Summary
The Operating System (OS) on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The "Debian GNU/Linux" Operating System on the remote host has reached the end o
↪f life.
CPE:                cpe:/o:debian:debian_linux:9
Installed version,
build or SP:        9
EOL date:           2022-06-30
EOL info:           https://en.wikipedia.org/wiki/List_of_Debian_releases#Release
↪_table
```

Impact
An EOL version of an OS is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: Mitigation
Update the OS on the remote host to a version which is still supported and receiving security updates by the vendor.
Note / Important: Please create an override for this result if the target host is a:
- Windows system with Extended Security Updates (ESU)
- System with additional 3rd-party / non-vendor security updates like e.g. from 'TuxCare', 'Freexian Extended LTS' or similar

Vulnerability Detection Method
Checks if an EOL version of an OS is present on the target host.
Details: `Operating System (OS) End of Life (EOL) Detection`
OID:1.3.6.1.4.1.25623.1.0.103674

Product detection result
`cpe:/a:apache:http_server:2.4.25`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.52
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.52 or later.

Affected Software/OS
Apache HTTP Server version 2.4.7 through 2.4.51.

Vulnerability Insight
A crafted URI sent to httpd configured as a forward proxy (ProxyRequests on) can cause a crash (NULL pointer dereference) or, for configurations mixing forward and reverse proxy declarations, can allow for requests to be directed to a declared Unix Domain Socket endpoint (Server Side Request Forgery).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 2.4.7 - 2.4.51 Multiple Vulnerabilities - Linux`

Summary
ISC BIND is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 9.11.3
Fixed version:     9.11.31
Installation
path / port:       53/udp
```

Impact
BIND servers are vulnerable if they are running an affected version and are configured to use GSS-TSIG features.
In a configuration which uses BIND's default settings the vulnerable code path is not exposed, but a server can be rendered vulnerable by explicitly setting values for the tkey-gssapi-keytab or tkey-gssapi-credential configuration options.
Although the default configuration is not vulnerable, GSS-TSIG is frequently used in networks where BIND is integrated with Samba, as well as in mixed-server environments that combine BIND servers with Active Directory domain controllers. For servers that meet these conditions, the ISC SPNEGO implementation is vulnerable to various attacks, depending on the CPU architecture for which BIND was built:
- For named binaries compiled for 64-bit platforms, this flaw can be used to trigger a buffer over-read, leading to a server crash.
- For named binaries compiled for 32-bit platforms, this flaw can be used to trigger a server crash due to a buffer overflow and possibly also to achieve remote code execution.

Solution:
Solution type: VendorFix
Update to version 9.11.31, 9.16.15, 9.17.2, 9.11.31-S1, 9.16.15-S1 or later.

Affected Software/OS
BIND 9.5.0 through 9.11.29, 9.12.0 through 9.16.13, 9.11.3-S1 through 9.11.29-S1, 9.16.8-S1 through 9.16.13-S1 and 9.17.0 through 9.17.1.

Vulnerability Insight
GSS-TSIG is an extension to the TSIG protocol which is intended to support the secure exchange of keys for use in verifying the authenticity of communications between parties on a network.
SPNEGO is a negotiation mechanism used by GSSAPI, the application protocol interface for GSS-TSIG.
The SPNEGO implementation used by BIND has been found to be vulnerable to a buffer overflow attack.

2.16.2 Critical 10000/tcp

Critical (CVSS: 9.8)
NVT: Webmin < 1.997 XSS Vulnerability

Summary
Webmin is prone to a cross-site scripting (XSS) vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
```
Installed version: 1.920
Fixed version:     1.997
Installation
path / port:       /
```

Solution:
Solution type: VendorFix
Update to version 1.997 or later.

Affected Software/OS
Webmin version prior to 1.997.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

Software/apt-lib.pl in Webmin lacks HTML escaping for a UI command.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Webmin < 1.997 XSS Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.124131
Version used: `2023-10-19T05:05:21Z`

References

cert-bund: WID-SEC-2022-0825
```

Critical (CVSS: 9.6)
NVT: Webmin <= 1.994 Multiple Vulnerabilities

Summary
Webmin is prone to multiple vulnerabilities.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
```
Installed version: 1.920
Fixed version:     None
Installation
path / port:       /
```

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
Webmin version 1.994 and prior.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2021-32156: A cross-site request forgery (CSRF) vulnerability exists via the Scheduled Cron Jobs feature.
- CVE-2021-32157: A cross-site scripting (XSS) vulnerability exists via the Scheduled Cron Jobs feature.
- CVE-2021-32158: An XSS vulnerability exists via the Upload and Download feature.

. . . continues on next page . . .

. . . continued from previous page . . .

- CVE-2021-32159: A CSRF vulnerability exists via the Upload and Download feature.
- CVE-2021-32160: An XSS vulnerability exists through the Add Users feature.
- CVE-2021-32161: An XSS vulnerability exists through the File Manager feature.
- CVE-2021-32162: A CSRF vulnerability exists through the File Manager feature.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Webmin <= 1.994 Multiple Vulnerabilities`
OID:1.3.6.1.4.1.25623.1.0.127047
Version used: `2023-10-19T05:05:21Z`

```

Critical (CVSS: 9.6)
NVT: Webmin <= 1.973 Multiple Vulnerabilities

Summary
Webmin is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 1.920
Fixed version:     See advisory
Installation
path / port:       /
```

Solution:
Solution type: Workaround
See the vendor advisory for a solution.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
Webmin version 1.973 and probably prior.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2021-31760: Cross Site Request Forgery (CSRF) which might lead to a Remote Command Execution (RCE) through Webmin's running process feature
- CVE-2021-31761: Reflected Cross Site Scripting (XSS) which might lead to an RCE through Webmin's running process feature
- CVE-2021-31762: CSRF to create a privileged user through Webmin's add users feature, and then get a reverse shell through Webmin's running process feature.
Note: The vendor added the following additional information regarding these vulnerabilities:
If Webmin is installed using the non-recommended setup.pl script, checking for unknown referrers is not enabled by default. This opens the system up to XSS and CSRF attacks using malicious links. Fortunately the standard RPM, Deb, TAR and Solaris packages do not use this script and so are not vulnerable. If you did install using the setup.pl script, the vulnerability can be fixed by adding the line 'referers_none=1' to '/etc/webmin/config'.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Webmin <= 1.973 Multiple Vulnerabilities`
OID:1.3.6.1.4.1.25623.1.0.145822
Version used: `2023-10-20T16:09:12Z`

2.16.3 Critical 53/tcp

Critical (CVSS: 10.0)
NVT: ISC BIND End of Life (EOL) Detection - Linux

Product detection result
```
cpe:/a:isc:bind:9.11.3
Detected by ISC BIND Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.145294)
```

. . . continues on next page . . .

. . . continued from previous page . . .

Summary
The ISC BIND version on the remote host has reached the End of Life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "ISC BIND" version on the remote host has reached the end of life.
CPE:               cpe:/a:isc:bind:9.11.3
Installed version: 9.11.3
Location/URL:      53/tcp
EOL version:       9.11
EOL date:          2021-12-31
```

Impact
An EOL version of ISC BIND is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: VendorFix
Update the ISC BIND version on the remote host to a still supported version.

Vulnerability Detection Method
Checks if an EOL version is present on the target host.
Details: `ISC BIND End of Life (EOL) Detection - Linux`
OID:1.3.6.1.4.1.25623.1.0.113016
Version used: `2025-04-15T05:54:49Z`

Product Detection Result
Product: `cpe:/a:isc:bind:9.11.3`
Method: `ISC BIND Detection Consolidation`

Critical (CVSS: 9.8)
NVT: ISC BIND Buffer Overflow Vulnerability (CVE-2021-25216) - Linux

Product detection result

```
cpe:/a:isc:bind:9.11.3
Detected by ISC BIND Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.145294)
```

. . . continues on next page . . .

. . . continued from previous page . . .

Summary
ISC BIND is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 9.11.3
Fixed version:     9.11.31
Installation
path / port:       53/tcp
```

Impact
BIND servers are vulnerable if they are running an affected version and are configured to use GSS-TSIG features.
In a configuration which uses BIND's default settings the vulnerable code path is not exposed, but a server can be rendered vulnerable by explicitly setting values for the tkey-gssapi-keytab or tkey-gssapi-credential configuration options.
Although the default configuration is not vulnerable, GSS-TSIG is frequently used in networks where BIND is integrated with Samba, as well as in mixed-server environments that combine BIND servers with Active Directory domain controllers. For servers that meet these conditions, the ISC SPNEGO implementation is vulnerable to various attacks, depending on the CPU architecture for which BIND was built:
- For named binaries compiled for 64-bit platforms, this flaw can be used to trigger a buffer over-read, leading to a server crash.
- For named binaries compiled for 32-bit platforms, this flaw can be used to trigger a server crash due to a buffer overflow and possibly also to achieve remote code execution.

Solution:
Solution type: VendorFix
Update to version 9.11.31, 9.16.15, 9.17.2, 9.11.31-S1, 9.16.15-S1 or later.

Affected Software/OS
BIND 9.5.0 through 9.11.29, 9.12.0 through 9.16.13, 9.11.3-S1 through 9.11.29-S1, 9.16.8-S1 through 9.16.13-S1 and 9.17.0 through 9.17.1.

Vulnerability Insight
GSS-TSIG is an extension to the TSIG protocol which is intended to support the secure exchange of keys for use in verifying the authenticity of communications between parties on a network.
SPNEGO is a negotiation mechanism used by GSSAPI, the application protocol interface for GSS-TSIG.
The SPNEGO implementation used by BIND has been found to be vulnerable to a buffer overflow attack.

Vulnerability Detection Method

. . . continues on next page . . .

. . . continued from previous page . . .

Checks if a vulnerable version is present on the target host.
Details: `ISC BIND Buffer Overflow Vulnerability (CVE-2021-25216) - Linux`

2.16.4 High 53/udp

High (CVSS: 8.6)
NVT: ISC BIND Cache-Poisoning Vulnerability (CVE-2025-40776, Birthday Attack) - Linux

Product detection result
`cpe:/a:isc:bind:9.11.3`
`Detected by ISC BIND Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.145294)`

Summary
ISC BIND is prone to a cache-poisoning vulnerability (Birthday Attack against Resolvers supporting ECS).

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 9.11.3
Fixed version:     9.20.11
Installation
path / port:       53/udp
```

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

A resolver configured to send ECS options to authoritative servers can be compelled to make queries that slightly increase the odds of guessing the source port and other details necessary to bypass the original birthday cache poisoning attack mitigations. As a result of this weakness, a resolver with ECS enabled is more vulnerable to successful cache poisoning via spoofed query responses than one that does not implement this feature.

Solution:
Solution type: VendorFix
Update to version 9.20.11, 9.18.38-S1, 9.20.11-S1 or later.

Affected Software/OS
ISC BIND version 9.0.0 through 9.20.10, 9.11.3-S1 through 9.16.50-S1, 9.18.11-S1 through 9.18.37-S1 and 9.20.9-S1 through 9.20.10-S1.

Vulnerability Insight
A named caching resolver that is configured to send ECS (EDNS Client Subnet) options may be vulnerable to a cache-poisoning attack.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `ISC BIND Cache-Poisoning Vulnerability (CVE-2025-40776, Birthday Attack) - Linux`
OID:1.3.6.1.4.1.25623.1.0.154963

NVT: ISC BIND Multiple DoS Vulnerabilities (CVE-2020-8616, CVE-2020-8617) - Linux

Product detection result
`cpe:/a:isc:bind:9.11.3`
`Detected by ISC BIND Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.145294)`

Summary
ISC BIND is prone to multiple denial of service vulnerabilities.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 9.11.3
Fixed version:     9.11.19
Installation
path / port:       53/udp
```

Solution:
Solution type: VendorFix
Update to version 9.11.19, 9.14.12, 9.16.3, 9.11.19-S1 or later.

Affected Software/OS
BIND 9.0.0 - 9.11.18, 9.12.0 - 9.12.4-P2, 9.14.0 - 9.14.11, 9.16.0 - 9.16.2, 9.17.0 -> 9.17.1 and 9.9.3-S1 - 9.11.18-S1. Also affects all releases in the obsolete 9.13 and 9.15 development branches.

Vulnerability Insight
ISC BIND is prone to multiple denial of service vulnerabilities:
- BIND does not sufficiently limit the number of fetches performed when processing referrals (CVE-2020-8616)
- A logic error in code which checks TSIG validity can be used to trigger an assertion failure in tsig.c (CVE-2020-8617)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: ISC BIND Cache Poisoning Vulnerability (CVE-2025-40778) - Linux

Product detection result

```
cpe:/a:isc:bind:9.11.3
Detected by ISC BIND Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.145294)
```

Summary

ISC BIND is prone to cache poisoning attacks with unsolicited RRs.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 9.11.3
Fixed version:     9.18.41
Installation
path / port:       53/udp
```

Impact

Forged records can be injected into cache during a query, which can potentially affect resolution of future queries.

Solution:

Solution type: VendorFix

Update to version 9.18.41, 9.18.41-S1, 9.20.15, 9.20.15-S1, 9.21.14 or later.

Affected Software/OS

ISC BIND versions 9.11.0 through 9.16.50, 9.18.0 through 9.18.39, 9.20.0 through 9.20.13, 9.21.0 through 9.21.12, 9.11.3-S1 through 9.16.50-S1, 9.18.11-S1 through 9.18.39-S1 and 9.20.9-S1 through 9.20.13-S1.

Vendor notes:

- Authoritative services are believed to be unaffected by this vulnerability but it is important to read: [link moved to references]

. . . continues on next page . . .

. . . continued from previous page . . .

- Resolvers are affected by this vulnerability.

Vulnerability Insight
Under certain circumstances, BIND is too lenient when accepting records from answers, allowing an attacker to inject forged data into the cache.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `ISC BIND Cache Poisoning Vulnerability (CVE-2025-40778) - Linux`

2.16.5 High 10000/tcp

High (CVSS: 8.8)
NVT: Webmin <= 1.983 RCE Vulnerability

Summary
Webmin is prone to a remote code execution (RCE) vulnerability.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
Installed version: 1.920
Fixed version:     None
Installation
path / port:       /
```

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
Webmin version 1.983 and prior.

Vulnerability Insight
Arbitrary command execution can occur in Webmin. Any user authorized for the Package Updates module can execute arbitrary commands with root privileges via vectors involving %0A and %0C.
NOTE: this issue exists because of an incomplete fix for CVE-2019-12840.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Webmin <= 1.983 RCE Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.145090

NVT: Webmin <= 1.991 Privilege Escalation Vulnerability

Summary
Webmin is prone to a privilege escalation vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
Installed version: 1.920
Fixed version:     1.994
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
Installation
path / port:        /
```

Solution:
Solution type: VendorFix
Update to version 1.994 or later.

Affected Software/OS
Webmin version 1.991 and prior.

Vulnerability Insight
Webmin, when the Authentic theme is used, allows remote code execution when a user has been manually created (i.e., not created in Virtualmin or Cloudmin). This occurs because settings-editor_write.cgi does not properly restrict the file parameter.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Webmin <= 1.991 Privilege Escalation Vulnerability`

`url: https://www.exploit-db.com/exploits/46984`

High (CVSS: 8.8)
NVT: Webmin <= 1.930 XXE Vulnerability

Summary
Webmin is prone to an authenticated XXE vulnerability in xmlrpc.cgi.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
```
Installed version: 1.920
Fixed version:     None
Installation
path / port:       /
```

Impact
Successful exploitation would allow an authenticated attacker to gain control over the target system.

Solution:
Solution type: WillNotFix

. . . continues on next page . . .

. . . continued from previous page . . .

No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
Webmin version 1.930 and prior.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Webmin <= 1.930 XXE Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.142805
Version used: `2021-09-08T08:01:40Z`

References
`cve: CVE-2019-15642`
`url: https://www.calypt.com/blog/index.php/authenticated-xxe-on-webmin/`
`cert-bund: CB-K19/0786`

High (CVSS: 8.8)
NVT: Webmin < 1.930 RCE Vulnerability

Summary
Webmin is prone to an authenticated remote code execution (RCE) vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
```
Installed version: 1.920
Fixed version:     1.930
Installation
path / port:       /
```

Impact
Successful exploitation would allow an authenticated attacker to gain control over the target system.

Solution:
Solution type: VendorFix
Update to version 1.930 or later.

Affected Software/OS
Webmin version 1.920 and prior.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

rpc.cgi in Webmin through 1.920 allows authenticated Remote Code Execution via a crafted object name because unserialise_variable makes an eval call.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Webmin < 1.930 RCE Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.142804

`cert-bund: CB-K19/0786`

High (CVSS: 8.8)
NVT: Webmin <= 1.984 Multiple Vulnerabilities

Summary
Webmin is prone to multiple vulnerabilities.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
```
Installed version: 1.920
Fixed version:     1.990
Installation
path / port:       /
```

Solution:
Solution type: VendorFix
Update to version 1.990 or later.

Affected Software/OS
Webmin version 1.984 and prior.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2022-0824: Improper access control leads to remote code execution (RCE)
- CVE-2022-0829: Improper authorization

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Webmin <= 1.984 Multiple Vulnerabilities`

[return to 172.31.1.101]

2.16.6 High 53/tcp

High (CVSS: 8.6)
NVT: ISC BIND Cache-Poisoning Vulnerability (CVE-2025-40776, Birthday Attack) - Linux

Product detection result

```
cpe:/a:isc:bind:9.11.3
Detected by ISC BIND Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.145294)
```

Summary

ISC BIND is prone to a cache-poisoning vulnerability (Birthday Attack against Resolvers supporting ECS).

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 9.11.3
Fixed version:     9.20.11
Installation
path / port:       53/tcp
```

Impact

A resolver configured to send ECS options to authoritative servers can be compelled to make queries that slightly increase the odds of guessing the source port and other details necessary to bypass the original birthday cache poisoning attack mitigations. As a result of this weakness, a resolver with ECS enabled is more vulnerable to successful cache poisoning via spoofed query responses than one that does not implement this feature.

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to version 9.20.11, 9.18.38-S1, 9.20.11-S1 or later.

Affected Software/OS
ISC BIND version 9.0.0 through 9.20.10, 9.11.3-S1 through 9.16.50-S1, 9.18.11-S1 through 9.18.37-S1 and 9.20.9-S1 through 9.20.10-S1.

Vulnerability Insight
A named caching resolver that is configured to send ECS (EDNS Client Subnet) options may be vulnerable to a cache-poisoning attack.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `ISC BIND Cache-Poisoning Vulnerability (CVE-2025-40776, Birthday Attack) - Linux`
OID:1.3.6.1.4.1.25623.1.0.154963

Product detection result
`cpe:/a:isc:bind:9.11.3`
`Detected by ISC BIND Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.145294)`

Summary
ISC BIND is prone to multiple denial of service vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
`Installed version: 9.11.3`

. . . continues on next page . . .

. . . continued from previous page . . .

```
Fixed version:     9.11.19
Installation
path / port:       53/tcp
```

Solution:
Solution type: VendorFix
Update to version 9.11.19, 9.14.12, 9.16.3, 9.11.19-S1 or later.

Affected Software/OS
BIND 9.0.0 - 9.11.18, 9.12.0 - 9.12.4-P2, 9.14.0 - 9.14.11, 9.16.0 - 9.16.2, 9.17.0 -> 9.17.1 and 9.9.3-S1 - 9.11.18-S1. Also affects all releases in the obsolete 9.13 and 9.15 development branches.

Vulnerability Insight
ISC BIND is prone to multiple denial of service vulnerabilities:
- BIND does not sufficiently limit the number of fetches performed when processing referrals (CVE-2020-8616)
- A logic error in code which checks TSIG validity can be used to trigger an assertion failure in tsig.c (CVE-2020-8617)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: ISC BIND Cache Poisoning Vulnerability (CVE-2025-40778) - Linux

Product detection result

```
cpe:/a:isc:bind:9.11.3
Detected by ISC BIND Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.145294)
```

Summary

ISC BIND is prone to cache poisoning attacks with unsolicited RRs.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 9.11.3
Fixed version:     9.18.41
Installation
path / port:       53/tcp
```

Impact

Forged records can be injected into cache during a query, which can potentially affect resolution of future queries.

Solution:

Solution type: VendorFix

Update to version 9.18.41, 9.18.41-S1, 9.20.15, 9.20.15-S1, 9.21.14 or later.

Affected Software/OS

ISC BIND versions 9.11.0 through 9.16.50, 9.18.0 through 9.18.39, 9.20.0 through 9.20.13, 9.21.0 through 9.21.12, 9.11.3-S1 through 9.16.50-S1, 9.18.11-S1 through 9.18.39-S1 and 9.20.9-S1 through 9.20.13-S1.

Vendor notes:

- Authoritative services are believed to be unaffected by this vulnerability but it is important to read: [link moved to references]
- Resolvers are affected by this vulnerability.

Vulnerability Insight

Under certain circumstances, BIND is too lenient when accepting records from answers, allowing an attacker to inject forged data into the cache.

NVT: PHP End of Life (EOL) Detection - Linux

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
The PHP version on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "PHP" version on the remote host has reached the end of life.
CPE:                cpe:/a:php:php:5.5.9
Installed version: 5.5.9
EOL version:        5.5
EOL date:           2016-07-21
```

Impact
An EOL version of PHP is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: VendorFix
Update the PHP version on the remote host to a still supported version.

Vulnerability Insight
Each release branch of PHP is fully supported for two years from its initial stable release. During this period, bugs and security issues that have been reported are fixed and are released in regular point releases.
After this two year period of active support, each branch is then supported for an additional year for critical security issues only. Releases during this period are made on an as-needed basis: there may be multiple point releases, or none, depending on the number of reports.
Once the three years of support are completed, the branch reaches its end of life and is no longer supported.

Vulnerability Detection Method
Checks if an EOL version is present on the target host.
Details: `PHP End of Life (EOL) Detection - Linux`
OID:1.3.6.1.4.1.25623.1.0.105889

Critical (CVSS: 9.8)
NVT: PHP < 7.1.33, 7.2.x < 7.2.24, 7.3.x < 7.3.11 RCE Vulnerability - Version Check

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to a remote code execution (RCE) vulnerability in certain nginx + php-fpm configurations.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 5.5.9
Fixed version:     7.1.33
Installation
path / port:       443/tcp
```

Impact
Successful exploitation would allow an unauthenticated remote attacker to execute arbitrary code on the target machine.

Solution:
Solution type: VendorFix
Update to version 7.1.33, 7.2.24, 7.3.11 or later.
As an alternative a workaround to update the nginx configuration to mitigate this vulnerability is described at the PHP.net bugtracker linked in the references.

Affected Software/OS
PHP prior to version 7.1.33, 7.2.x prior to 7.2.24 and 7.3.x prior to 7.3.11.

Vulnerability Insight
The file sapi/fpm/fpm/fpm_main.c contains pointer arithmetic that assumes that env_path_info has a prefix equal to the path to the php script. However, the code does not check this assumption is satisfied. The absence of the check can lead to an invalid pointer in the 'path_info' variable.
Such conditions can be achieved in a pretty standard Nginx configuration. The regexp in 'fastcgi_split_path_info' directive can be broken using the newline character (in encoded form, %0a). Broken regexp leads to empty PATH_INFO, which triggers the bug.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 7.1.33, 7.2.x < 7.2.24, 7.3.x < 7.3.11 RCE Vulnerability - Version Check`

Critical (CVSS: 9.8)
NVT: PHP < 5.6.26 DoS Vulnerability - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.26
Installation
```

. . . continues on next page . . .

. . . continued from previous page . . .

path / port: 443/tcp

Impact
Successfully exploiting this issue allow remote attackers to cause a denial of service.

Solution:
Solution type: VendorFix
Update to version 5.6.26 or later.

Affected Software/OS
PHP prior to version 5.6.26 on Linux.

Vulnerability Insight
The flaw is due to improper handling of object-deserialization failures in 'ext/standard/var_unserializer.re' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: PHP < 5.6.26 DoS Vulnerability - Linux
OID:1.3.6.1.4.1.25623.1.0.809321
Version used: 2025-09-24T05:39:03Z

Product detection result

. . . continues on next page . . .

. . . continued from previous page . . .

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary
PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.29
Installation
path / port:       443/tcp
```

Solution:
Solution type: VendorFix
Update to version 5.6.29, 7.0.14 or later.

Affected Software/OS
PHP versions prior to 5.6.29 and 7.0.x prior to 7.0.14.

Vulnerability Insight
The php_wddx_push_element function in ext/wddx/wddx.c allows remote attackers to cause a denial of service (out-of-bounds read and memory corruption) or possibly have unspecified other impact via an empty boolean element in a wddxPacket XML document.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.29, 7.0.x < 7.0.14 DoS Vulnerability - Linux`

NVT: PHP < 5.5.37, 5.6.x < 5.6.23, 7.x < 7.0.8 Multiple Vulnerabilities (Aug 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.37
Installation
path / port:       443/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to cause a denial of service (buffer overflow and application crash) or possibly execute arbitrary code.

Solution:

Solution type: VendorFix

Update to PHP version 5.5.37, 5.6.23, 7.0.8 or later.

Affected Software/OS

PHP prior to version 5.5.37, 5.6.x prior to 5.6.23 and 7.x prior to 7.0.8 on Linux.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

The following flaws exist:
- The 'php_zip.c' script in the zip extension improperly interacts with the unserialize implementation and garbage collection.
- The php_wddx_process_data function in 'wddx.c' script in the WDDX extension mishandled data in a wddx_deserialize call.
- The multiple integer overflows in 'mcrypt.c' script in the mcrypt extension.
- The double free vulnerability in the '_php_mb_regex_ereg_replace_exec' function in 'php_mbregex.c' script in the mbstring extension.
- An integer overflow in the '_gd2GetHeader' function in 'gd_gd2.c' script in the GD Graphics Library.
- An integer overflow in the 'gdImageCreate' function in 'gd.c' script in the GD Graphics Library.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Impact
Successfully exploiting these issues allow remote attackers to cause a denial of service (buffer overflow and application crash) or possibly execute arbitrary code.

Solution:
Solution type: VendorFix
Update to version 5.5.34, 5.6.20, 7.0.5 or later.

Affected Software/OS
PHP prior to version 5.5.34, 5.6.x prior to 5.6.20 and 7.0.x prior to 7.0.5 on Linux.

Vulnerability Insight
The following flaws exist:
- Multiple integer overflows in the mbfl_strcut function in 'ext/mbstring/libmbfl/mbfl/mbfilter.c' script.
- Format string vulnerability in the php_snmp_error function in 'ext/snmp/snmp.c' script.
- An improper handling of '\0' characters by the 'phar_analyze_path' function in 'ext/phar/phar.c' script.
- An integer overflow in the 'php_raw_url_encode' function in 'ext/standard/url.c' script.
- An improper handling of continuation-level jumps in 'file_check_mem' function in 'funcs.c' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Solution:

. . . continues on next page . . .

. . . continued from previous page . . .

Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
PHP versions through 7.1.5.

Vulnerability Insight
The following flaws exist:
- CVE-2017-8923: The zend_string_extend function in Zend/zend_string.h does not prevent changes to string objects that result in a negative length, which allows remote attackers to cause a denial of service (application crash) or possibly have unspecified other impact by leveraging a script's use of .= with a long string.
- CVE-2017-9119: The i_zval_ptr_dtor function in Zend/zend_variables.h allows attackers to cause a denial of service (memory consumption and application crash) or possibly have unspecified other impact by triggering crafted operations on array data structures.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: PHP < 5.4.42, 5.5.x < 5.5.26, 5.6.x < 5.6.10 Multiple Vulnerabilities (Aug 2016) - Linux

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.26
Installation
path / port:       443/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to cause a denial of service, to read or write to arbitrary files, also execute arbitrary code via a long reply to a LIST command, leading to a heap-based buffer overflow.

Solution:
Solution type: VendorFix
Update to version 5.4.42, 5.5.26, 5.6.10 or later.

Affected Software/OS
PHP prior to version 5.4.42, 5.5.x prior to 5.5.26 and 5.6.x prior to 5.6.10 on Linux.

Vulnerability Insight
The following flaws exist:
- Improper validation of token extraction for table names, in the php_pgsql_meta_data function in pgsql.c in the PostgreSQL extension.
- Integer overflow in the ftp_genlist function in ext/ftp/ftp.c
- PHP does not ensure that pathnames lack %00 sequences.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.28
Installation
path / port:       443/tcp
```

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

Successfully exploiting this issue allow remote attackers to cause a denial of service (NULL pointer dereference and application crash) or trigger unintended method execution to defeat cryptographic protection mechanisms.

Solution:
Solution type: VendorFix
Update to version 5.4.44, 5.5.28, 5.6.12 or later.

Affected Software/OS
PHP prior to version 5.4.44, 5.5.x prior to 5.5.28 and 5.6.x prior to 5.6.12 on Linux.

Vulnerability Insight
Multiple flaws exist due to:
- An improper validation of certain Exception objects in 'Zend/zend_exceptions.c' script.
- The 'openssl_random_pseudo_bytes' function in 'ext/openssl/openssl.c' incorrectly relies on the deprecated 'RAND_pseudo_bytes' function.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.4.44, 5.5.x < 5.5.28, 5.6.x < 5.6.12 Multiple Vulnerabilities (Jul 2016. ↪..`

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.38
Installation
path / port:       443/tcp
```

Impact

Successfully exploiting these issues may allow attackers to cause a denial of service obtain sensitive information from process memory, or possibly have unspecified other impact.

Solution:

Solution type: VendorFix

Update to version 5.5.38, 5.6.24, 7.0.9 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
PHP prior to version 5.5.38, 5.6.x prior to 5.6.24 and 7.x prior to 7.0.9.

Vulnerability Insight
The following flaws exist:
- Integer overflow in the 'php_stream_zip_opener' function in 'ext/zip/zip_stream.c'
- Integer signedness error in the 'simplestring_addn' function in 'simplestring.c' in xmlrpc-epi
- 'ext/snmp/snmp.c' improperly interacts with the unserialize implementation and garbage collection
- The 'locale_accept_from_http' function in 'ext/intl/locale/locale_methods.c' does not properly restrict calls to the ICU 'uloc_acceptLanguageFromHTTP' function
- Error in the 'exif_process_user_comment' function of 'ext/exif/exif.c'
- Error in the 'exif_process_IFD_in_MAKERNOTE' function of 'ext/exif/exif.c'
- 'ext/session/session.c' does not properly maintain a certain hash data structure
- Integer overflow in the 'virtual_file_ex' function of 'TSRM/tsrm_virtual_cwd.c'
- Error in the 'php_url_parse_ex' function of 'ext/standard/url.c'
- Integer overflow error within _gdContributionsAlloc()
- Inadequate error handling in bzread()

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.38, 5.6.x < 5.6.24, 7.0.x < 7.0.9 Multiple Vulnerabilities (Jul 2016).`

Summary

PHP is prone to a use-after-free vulnerability in a used third-pary library.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     7.1.32
Installation
```

. . . continues on next page . . .

. . . continued from previous page . . .

path / port: 443/tcp

Impact
This flaw allows attackers to potentially cause information disclosure, denial of service, or possibly code execution by providing a crafted regular expression.

Solution:
Solution type: VendorFix
Update to version 7.1.32, 7.3.9 or later.

Affected Software/OS
PHP version before 7.1.32 and 7.3.x before 7.3.9.

Vulnerability Insight
The flaw exists due to a use-after-free in onig_new_deluxe() in regext.c of the third-party library Oniguruma 6.9.2 which is used by PHP.
The attacker provides a pair of a regex pattern and a string, with a multi-byte encoding that gets handled by onig_new_deluxe().

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: PHP <= 5.6.27 / 7.0.x <= 7.0.12 DoS Vulnerability

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a denial of service (DoS) vulnerability.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     None
Installation
path / port:       443/tcp
```

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
PHP versions through 5.6.27 and 7.0.x through 7.0.12.

Vulnerability Insight
PHP mishandles property modification during __wakeup processing, which allows remote attackers to cause a denial of service or possibly have unspecified other impact via crafted serialized data, as demonstrated by Exception::__toString with DateInterval::__wakeup.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP <= 5.6.27 / 7.0.x <= 7.0.12 DoS Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.117802
Version used: `2025-09-24T05:39:03Z`

Product Detection Result
Product: `cpe:/a:php:php:5.5.9`
Method: `PHP Detection Consolidation`
OID: 1.3.6.1.4.1.25623.1.0.171722)

Critical (CVSS: 9.8)
NVT: PHP < 5.3.29, 5.4.x < 5.4.30, 5.5.x < 5.5.14 Multiple Vulnerabilities (Jun/Aug 2014) - Linux

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 5.5.9
Fixed version:     5.5.14
Installation
path / port:       443/tcp
```

Solution:
Solution type: VendorFix
Update to version 5.3.29, 5.4.30, 5.5.14 or later.

Affected Software/OS
PHP versions 5.3.x prior to 5.3.29, 5.4.x prior to 5.4.30 and 5.5.x prior to 5.5.14.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2014-3981: Insecure temporary file use in the configure script
- CVE-2014-4721: phpinfo() Type Confusion Information Leak Vulnerability
- CVE-2014-0207: cdf_read_short_sector insufficient boundary check
- CVE-2014-3478: mconvert incorrect handling of truncated pascal string size
- CVE-2014-3479: cdf_check_stream_offset insufficient boundary check
- CVE-2014-3480: cdf_count_chain insufficient boundary check
- CVE-2014-3487: cdf_read_property_info insufficient boundary check
- CVE-2014-4049: Fix potential segfault in dns_get_record()
- CVE-2014-3515: unserialize() SPL ArrayObject / SPLObjectStorage Type Confusion
- CVE-2014-9912: Buffer overflow in locale_get_display_name and uloc_getDisplayName (libicu 4.8.1)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.3.29, 5.4.x < 5.4.30, 5.5.x < 5.5.14 Multiple Vulnerabilities (Jun/Aug . ↪..`

Critical (CVSS: 9.8)
NVT: PHP < 8.0.30, 8.1.x < 8.1.22, 8.2.x < 8.2.9 Security Update - Linux

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 5.5.9
Fixed version:     8.0.30
Installation
path / port:       443/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.0.30, 8.1.22, 8.2.9 or later.

Affected Software/OS
PHP prior to version 8.0.30, 8.1.x prior to 8.1.22 and 8.2.x prior to 8.2.9.

Vulnerability Insight
The following flaws exist:
- CVE-2023-3823: Fixed bug GHSA-3qrf-m4j2-pcrr (Security issue with external entity loading in XML without enabling it)
- CVE-2023-3824: Fixed bug GHSA-jqcx-ccgc-xwhv (Buffer mismanagement in phar_dir_read())

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: PHP < 5.4.40, 5.5.x < 5.5.24, 5.6.x < 5.6.8 Multiple Vulnerabilities - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.24
Installation
path / port:       443/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to cause a denial of service, to obtain sensitive information from process memory and to execute arbitrary code via crafted dimensions.

Solution:

Solution type: VendorFix

Update to version 5.4.40, 5.5.24, 5.6.8 or later.

Affected Software/OS

PHP prior to version 5.4.40, 5.5.x prior to 5.5.24 and 5.6.x prior to 5.6.8.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
The following flaws exist:
- Multiple stack-based buffer overflows in the 'phar_set_inode' function in phar_internal.h script in PHP.
- Vulnerabilities in 'phar_parse_metadata' and 'phar_parse_pharfile' functions in ext/phar/phar.c script in PHP.
- A NULL pointer dereference flaw in the 'build_tablename' function in 'ext/pgsql/pgsql.c' script that is triggered when handling NULL return values for 'token'

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.4.40, 5.5.x < 5.5.24, 5.6.x < 5.6.8 Multiple Vulnerabilities - Linux`

NVT: PHP < 5.6.31, 7.0.x < 7.0.21, 7.1.x < 7.1.7 Multiple Vulnerabilities (Jul 2017) - Linux

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.31
Installation
path / port:       443/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to leak information from the interpreter, crash PHP interpreter and also disclose sensitive information.

Solution:
Solution type: VendorFix
Update to version 5.6.31, 7.0.21, 7.1.7 or later.

Affected Software/OS
PHP prior to version 5.6.31, 7.0.x prior to 7.0.21 and 7.1.x prior to 7.1.7.

Vulnerability Insight
The following vulnerabilities exist:
- An ext/date/lib/parse_date.c out-of-bounds read affecting the php_parse_date function.
- The openssl extension PEM sealing code did not check the return value of the OpenSSL sealing function.
- lack of bounds checks in the date extension's timelib_meridian parsing code.
- A stack-based buffer overflow in the zend_ini_do_op() function in the 'Zend/zend_ini_parser.c' script.
- The GIF decoding function gdImageCreateFromGifCtx in gd_gif_in.c in the GD Graphics Library (aka libgd) does not zero colorMap arrays before use.
- Heap buffer overread (READ: 1) finish_nested_data from unserialize
- oniguruma upstream fix

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.31, 7.0.x < 7.0.21, 7.1.x < 7.1.7 Multiple Vulnerabilities (Jul 2017).`

Critical (CVSS: 9.8)
NVT: Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.52
Installation
path / port:       443/tcp
```

Solution:

Solution type: VendorFix

Update to version 2.4.52 or later.

Affected Software/OS

Apache HTTP Server versions through 2.4.51.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

A carefully crafted request body can cause a buffer overflow in the mod_lua multipart parser (r:parsebody() called from Lua scripts).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.35
Installation
path / port:       443/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to cause a denial of service (out-of-bounds read) or possibly have unspecified other impact.

Solution:
Solution type: VendorFix
Update to version 5.5.35, 5.6.21, 7.0.6 or later.

Affected Software/OS
PHP prior to version 5.5.35, 5.6.x prior to 5.6.21 and 7.x prior to 7.0.6 on Linux.

Vulnerability Insight
The following flaws exist:
- Improper validation of TIFF start data in 'exif_process_TIFF_in_JPEG' function in 'ext/exif/exif.c' script.
- Improper validation of IFD sizes in 'exif_process_TIFF_in_JPEG' function in 'ext/exif/exif.c' script.
- Improper construction of spprintf arguments, in 'exif_process_TIFF_in_JPEG' function in 'ext/exif/exif.c' script.
- Error in 'grapheme_strpos function' in 'ext/intl/grapheme/grapheme_string.c'.
- Error in 'xml_parse_into_struct' function in 'ext/xml/xml.c' script.
- The 'bcpowmod' function in 'ext/bcmath/bcmath.c' improperly modifies certain data structures.
- Improper validation of input passed to 'bcpowmod' function in 'ext/bcmath/bcmath.c' script.
- Error in 'grapheme_strpos' function in ext/intl/grapheme/grapheme_string.c script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.48
Installation
path / port:       443/tcp
```

Impact

- CVE-2020-35452: A specially crafted Digest nonce can cause a stack overflow in mod_auth_digest.
- CVE-2021-26690: A specially crafted Cookie header handled by mod_session can cause a NULL pointer dereference and crash, leading to a possible Denial Of Service.
- CVE-2021-26691: A specially crafted SessionHeader sent by an origin server could cause a heap overflow.

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to version 2.4.48 or later.

Affected Software/OS
Apache HTTP Server versions 2.4.0 to 2.4.46 on Linux.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2020-35452: mod_auth_digest possible stack overflow by one null byte
- CVE-2021-26690: mod_session NULL pointer dereference
- CVE-2021-26691: mod_session response handling heap overflow

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Product detection result
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 5.5.9
Fixed version: 5.5.33
Installation
path / port: 443/tcp

. . . continues on next page . . .

. . . continued from previous page . . .

Impact
Successfully exploiting these issues allow remote attackers to gain access to potentially sensitive information and conduct a denial of service (memory corruption and application crash).

Solution:
Solution type: VendorFix
Update to PHP version 5.5.33, 5.6.19 or later.

Affected Software/OS
PHP prior to version 5.5.33 and 5.6.x prior to 5.6.19 on Linux.

Vulnerability Insight
The following flaws exist:
- Use-after-free error in wddx.c script in the WDDX extension in PHP
- Error in the phar_parse_zipfile function in zip.c script in the PHAR extension in PHP.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: Apache HTTP Server Multiple Vulnerabilities (Apr 2018) - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.30
Installation
path / port:       443/tcp
```

Impact

Successful exploitation will allow an attacker to replay HTTP requests across servers without detection, influence the user content, upload a malicious file, crash the Apache HTTP Server and perform denial of service attack.

Solution:

Solution type: VendorFix

Update to version 2.4.30 or later. Please see the references for more information.

Affected Software/OS

. . . continues on next page . . .

. . . continued from previous page . . .

Apache HTTP Server versions from 2.4.1 to 2.4.4, 2.4.6, 2.4.7, 2.4.9, 2.4.10, 2.4.12, 2.4.16 to 2.4.18, 2.4.20, 2.4.23, 2.4.25 to 2.4.29.

Vulnerability Insight
Multiple flaws exist due to:
- Apache HTTP Server fails to correctly generate the nonce sent to prevent reply attacks.
- Misconfigured mod_session variable, HTTP_SESSION.
- Apache HTTP Server fails to sanitize the expression specified in '<FilesMatch>'.
- An error in Apache HTTP Server 'mod_authnz_ldap' when configured with AuthLDAPCharsetConfig.
- Apache HTTP Server fails to sanitize against a specially crafted request.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: PHP < 5.4.45, 5.5.x < 5.5.29, 5.6.x < 5.6.13 Multiple Vulnerabilities (Jul 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.29
Installation
path / port:       443/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to read arbitrary empty directories, also to cause a denial of service.

Solution:

Solution type: VendorFix

Update to version 5.4.45, 5.5.29, 5.6.13 or later.

Affected Software/OS

PHP prior to version 5.4.45, 5.5.x prior to 5.5.29 and 5.6.x prior to 5.6.13 on Linux.

Vulnerability Insight

The following flaws exist:
- Error in the 'ZipArchive::extractTo' function in 'ext/zip/php_zip.c' script.
- The xsl_ext_function_php function in ext/xsl/xsltprocessor.c when libxml2 is used, does not consider the possibility of a NULL valuePop return value before proceeding with a free operation after the principal argument loop.
- Improper handling of multiple php_var_unserialize calls
- Multiple use-after-free vulnerabilities

Vulnerability Detection Method

. . . continues on next page . . .

. . . continued from previous page . . .

Checks if a vulnerable version is present on the target host.

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.37
Installation
path / port:       443/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to cause a denial of service (use-after-free and application crash) or possibly execute arbitrary code or possibly have unspecified other impact via a large integer argument.

Solution:

Solution type: VendorFix

Update to version 5.5.37, 5.6.23 or later.

Affected Software/OS

PHP prior to version 5.5.37 and 5.6.x prior to 5.6.23 on Linux.

Vulnerability Insight

The following flaws exist:

- The 'spl_array.c' in the SPL extension improperly interacts with the unserialize implementation and garbage collection.

- Integer overflow in the 'SplFileObject::fread' function in 'spl_directory.c' in the SPL extension.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.54
Installation
path / port:       443/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.54 or later.

Affected Software/OS
Apache HTTP Server version 2.4.53 and prior.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2022-26377: mod_proxy_ajp: Possible request smuggling
- CVE-2022-28614: Read beyond bounds via ap_rwrite()
- CVE-2022-28615: Read beyond bounds in ap_strcmp_match()
- CVE-2022-29404: Denial of service in mod_lua r:parsebody
- CVE-2022-30556: Information disclosure in mod_lua with websockets
- CVE-2022-31813: mod_proxy X-Forwarded-For dropped by hop-by-hop mechanism

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a stack buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.34
Installation
path / port:       443/tcp
```

Impact

Successful exploitation will allow an attacker to execute arbitrary code in the context of the affected application. Failed exploit attempts will result in denial-of-service conditions.

Solution:

Solution type: VendorFix

Update to version 5.6.34, 7.0.28, 7.1.15, 7.2.3 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
PHP versions 5.x prior to 5.6.34, 7.x prior to 7.0.28, 7.1.x prior to 7.1.15 and 7.2.x prior to 7.2.3 on Linux.

Vulnerability Insight
The flaw exists because php fails to adequately bounds-check user-supplied data before copying it into an insufficiently sized buffer.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP 5.x < 5.6.34, 7.x < 7.0.28, 7.1.x < 7.1.15, 7.2.x < 7.2.3 Stack Buffer Over.`

. . . continued from previous page . . .

↪.0.117232)

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.26
Installation
path / port:       443/tcp
```

Impact
Successful exploitation will allow remote attackers to bypass authentication and perform unauthorized actions, cause a denial-of-service condition and gain access to potentially sensitive information.

Solution:
Solution type: VendorFix
Update to Apache HTTP Server 2.2.33 or 2.4.26 or later.

Affected Software/OS
Apache HTTP Server 2.2.x before 2.2.33 and 2.4.x before 2.4.26.

Vulnerability Insight
Multiple flaws exist as,
- The mod_mime can read one byte past the end of a buffer when sending a malicious Content-Type response header.
- The mod_ssl may dereference a NULL pointer when third-party modules call ap_hook_process_connection() during an HTTP request to an HTTPS port.
- An use of the ap_get_basic_auth_pw() by third-party modules outside of the authentication phase may lead to authentication requirements being bypassed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Fixed version: 5.6.30
Installation
path / port: 443/tcp

Solution:
Solution type: VendorFix
Update to version 5.6.30, 7.0.15, 7.1.1 or later.

Affected Software/OS
PHP prior to version 5.6.30, 7.x prior to 7.0.15 and 7.1.x prior to 7.1.1.

Vulnerability Insight
The following flaws exist:
- CVE-2016-10161: Heap out of bounds read on unserialize in finish_nested_data()
- CVE-2016-10158: FPE when parsing a tag format
- CVE-2016-10168: Signed Integer Overflow gd_io.c
- CVE-2016-10167: DOS vulnerability in gdImageCreateFromGd2Ctx()
- CVE-2017-11147: Seg fault when loading hostile phar
- CVE-2016-10160: Memory corruption when loading hostile phar
- CVE-2016-10159: Crash while loading hostile phar archive

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: PHP < 5.6.30, 7.x < 7.0.15, 7.1.x < 7.1.1 Multiple Vulnerabilities (Jan 2017) -.

Critical (CVSS: 9.8)
NVT: PHP < 7.0.12 RCE / DoS Vulnerability - Linux

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to a remote code execution (RCE) or denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     7.0.12
Installation
path / port:       443/tcp
```

Solution:
Solution type: VendorFix
Update to version 7.0.12 or later.

Affected Software/OS
PHP versions prior to 7.0.12.

Vulnerability Insight
The SplObjectStorage unserialize implementation in ext/spl/spl_observer.c does not verify that a key is an object, which allows remote attackers to execute arbitrary code or cause a denial of service (uninitialized memory access) via crafted serialized data.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 7.0.12 RCE / DoS Vulnerability - Linux`

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP released new versions which include a security fix.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     7.4.28
Installation
path / port:       443/tcp
```

Solution:

Solution type: VendorFix

Update to version 7.4.28, 8.0.16, 8.1.3 or later.

Affected Software/OS

PHP prior to version 7.4.28, 8.0.x through 8.0.15 and 8.1.x through 8.1.2.

Vulnerability Insight

Fix #81708: UAF due to php_filter_float() failing for ints.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Impact
Successfully exploiting these issues allow remote attackers to execute arbitrary code in the context of the PHP process. Failed exploit attempts will likely crash the webserver.

Solution:
Solution type: VendorFix
Update to version 5.4.43, 5.5.27, 5.6.11 or later.

Affected Software/OS
PHP prior to version 5.4.43, 5.5.x prior to 5.5.27 and 5.6.x prior to 5.6.11 on Linux.

Vulnerability Insight
The following flaws exist:
- Inadequate boundary checks on user-supplied input by 'phar_fix_filepath' function in 'ext/phar/phar.c' script.
- Improper validation of file pointer in the 'phar_convert_to_other' function in 'ext/phar/phar_object.c' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.4.43, 5.5.x < 5.5.27, 5.6.x < 5.6.11 Multiple Vulnerabilities (Mar 2016. ↪..`

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.26
Installation
path / port:       443/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to cause a denial of service, or possibly have unspecified other impact.

Solution:

Solution type: VendorFix

Update to version 5.6.26, 7.0.11 or later.

Affected Software/OS

PHP prior to version 5.6.26 and 7.x prior to 7.0.11 on Linux.

Vulnerability Insight

The following flaws exist:

- Use-after-free vulnerability in the 'wddx_stack_destroy' function in 'ext/wddx/wddx.c' script.

. . . continues on next page . . .

. . . continued from previous page . . .

- Improper verification of a BIT field has the UNSIGNED_FLAG flag in 'ext/mysqlnd/mysqlnd_wireprotocol.c' script.
- The ZIP signature-verification feature does not ensure that the uncompressed_filesize field is large enough.
- The script 'ext/spl/spl_array.c' proceeds with SplArray unserialization without validating a return value and data type.
- The script 'ext/intl/msgformat/msgformat_format.c' does not properly restrict the locale length provided to the Locale class in the ICU library.
- An error in the php_wddx_push_element function in ext/wddx/wddx.c.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a HTTP request smuggling vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.56
Installation
path / port:       443/tcp
```

Impact

Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

Solution:

Solution type: VendorFix

Update to version 2.4.56 or later.

Affected Software/OS

Apache HTTP Server versions 2.4.0 through 2.4.55.

Vulnerability Insight

Some mod_proxy configurations allow a HTTP Request Smuggling attack.
Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

```
Fixed version:     8.1.31
Installation
path / port:       443/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.1.31, 8.2.26, 8.3.14 or later.

Affected Software/OS
PHP versions prior to 8.1.31, 8.2.x prior to 8.2.26 and 8.3.x prior to 8.3.14.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2024-8929: Leak partial content of the heap through heap buffer over-read
- CVE-2024-8932: OOB access in ldap_escape
- CVE-2024-11233: Single byte overread with convert.quoted-printable-decode filter
- CVE-2024-11234: Configuring a proxy in a stream context might allow for CRLF injection in URIs
- CVE-2024-11236: Integer overflow in the firebird/dblib quoter causing OOB writes
- No CVE: Heap-Use-After-Free in sapi_read_post_data Processing in CLI SAPI Interface

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.25
Installation
path / port:       443/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to cause a denial of service, to obtain sensitive information from process memory, to inject arbitrary-type session data by leveraging control of a session name.

Solution:

Solution type: VendorFix

Update to version 5.6.25, 7.0.10 or later.

Affected Software/OS

PHP prior to version 5.6.25 and 7.x prior to 7.0.10 on Linux.

Vulnerability Insight

The following flaws exist:

- Invalid wddxPacket XML document that is mishandled in a wddx_deserialize call in 'ext/wddx/wddx.c' script.
- Error in 'php_wddx_pop_element' function in 'ext/wddx/wddx.c' script.
- An error in 'php_wddx_process_data' function in 'ext/wddx/wddx.c' script.
- Improper handling of the case of a thumbnail offset that exceeds the file size in 'exif_process_IFD_in_TIFF' function in 'ext/exif/exif.c' script.
- Improper validation of gamma values in 'imagegammacorrect' function in 'ext/gd/gd.c' script.
- Improper validation of number of colors in 'imagegammacorrect' function in 'ext/gd/gd.c' script.
- The script 'ext/session/session.c' skips invalid session names in a way that triggers incorrect parsing.
- Improper handling of certain objects in 'ext/standard/var_unserializer.c' script.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `PHP < 5.6.25, 7.x < 7.0.10 Multiple Vulnerabilities (Sep 2016) - Linux`

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to an XML external entity (XXE) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
Fixed version:      5.5.22
Installation
path / port:        443/tcp
```

Impact
Successfully exploiting this issue allow remote attackers to conduct XML External Entity (XXE) and XML Entity Expansion (XEE) attacks.

Solution:
Solution type: VendorFix
Update to PHP version 5.5.22, 5.6.6 or later.

Affected Software/OS
PHP prior to version 5.5.22 and 5.6.x prior to 5.6.6 on Linux.

Vulnerability Insight
The flaw is due to script 'ext/libxml/libxml.c' does not isolate each thread from 'libxml_disable_entity_loader' when PHP-FPM is used.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.22, 5.6.x < 5.6.6 XXE Vulnerability - Linux`

NVT: Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.27
Installation
path / port:       443/tcp
```

Impact

Successful exploitation will allow remote attackers to cause the target service to crash. A remote user can obtain potentially sensitive information as well on the target system.

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to Apache HTTP Server 2.2.34 or 2.4.27 or later.

Affected Software/OS
Apache HTTP Server 2.2.x before 2.2.34 and 2.4.x before 2.4.27.

Vulnerability Insight
The flaw exists due to error in Apache 'mod_auth_digest' which does not properly initialize memory used to process 'Digest' type HTTP Authorization headers.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux`

NVT: PHP < 5.5.31, 5.6.x < 5.6.17, 7.x < 7.0.2 DoS Vulnerability (Aug 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.31
Installation
path / port:       443/tcp
```

Impact

Successfully exploiting this issue allow attackers to obtain sensitive information from process memory or cause a denial of service (out-of-bounds read and buffer overflow) via a long string.

Solution:

Solution type: VendorFix

Update to version 5.5.31, 5.6.17, 7.0.2 or later.

Affected Software/OS

PHP prior to version 5.5.31, 5.6.x prior to 5.6.17 and 7.x prior to 7.0.2 on Linux.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
The flaw is due to the 'sapi/fpm/fpm/fpm_log.c' script misinterprets the semantics of the snprintf return value.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

2.17.2 Critical 80/tcp

Critical (CVSS: 10.0)
NVT: PHP End of Life (EOL) Detection - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

The PHP version on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "PHP" version on the remote host has reached the end of life.
CPE:                cpe:/a:php:php:5.5.9
Installed version: 5.5.9
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
EOL version:        5.5
EOL date:           2016-07-21
```

Impact
An EOL version of PHP is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: VendorFix
Update the PHP version on the remote host to a still supported version.

Vulnerability Insight
Each release branch of PHP is fully supported for two years from its initial stable release. During this period, bugs and security issues that have been reported are fixed and are released in regular point releases.
After this two year period of active support, each branch is then supported for an additional year for critical security issues only. Releases during this period are made on an as-needed basis: there may be multiple point releases, or none, depending on the number of reports.
Once the three years of support are completed, the branch reaches its end of life and is no longer supported.

Vulnerability Detection Method
Checks if an EOL version is present on the target host.
Details: `PHP End of Life (EOL) Detection - Linux`

NVT: PHP < 5.4.42, 5.5.x < 5.5.26, 5.6.x < 5.6.10 Multiple Vulnerabilities (Aug 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.26
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
Installation
path / port:        80/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to cause a denial of service, to read or write to arbitrary files, also execute arbitrary code via a long reply to a LIST command, leading to a heap-based buffer overflow.

Solution:
Solution type: VendorFix
Update to version 5.4.42, 5.5.26, 5.6.10 or later.

Affected Software/OS
PHP prior to version 5.4.42, 5.5.x prior to 5.5.26 and 5.6.x prior to 5.6.10 on Linux.

Vulnerability Insight
The following flaws exist:
- Improper validation of token extraction for table names, in the php_pgsql_meta_data function in pgsql.c in the PostgreSQL extension.
- Integer overflow in the ftp_genlist function in ext/ftp/ftp.c
- PHP does not ensure that pathnames lack %00 sequences.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.4.42, 5.5.x < 5.5.26, 5.6.x < 5.6.10 Multiple Vulnerabilities (Aug 2016. ↪..`

cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.35
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to cause a denial of service (out-of-bounds read) or possibly have unspecified other impact.

Solution:

Solution type: VendorFix

Update to version 5.5.35, 5.6.21, 7.0.6 or later.

Affected Software/OS

PHP prior to version 5.5.35, 5.6.x prior to 5.6.21 and 7.x prior to 7.0.6 on Linux.

Vulnerability Insight

The following flaws exist:

- Improper validation of TIFF start data in 'exif_process_TIFF_in_JPEG' function in 'ext/exif/exif.c' script.
- Improper validation of IFD sizes in 'exif_process_TIFF_in_JPEG' function in 'ext/exif/exif.c' script.
- Improper construction of spprintf arguments, in 'exif_process_TIFF_in_JPEG' function in 'ext/exif/exif.c' script.
- Error in 'grapheme_strpos function' in 'ext/intl/grapheme/grapheme_string.c'.
- Error in 'xml_parse_into_struct' function in 'ext/xml/xml.c' script.

. . . continues on next page . . .

. . . continued from previous page . . .

- The 'bcpowmod' function in 'ext/bcmath/bcmath.c' improperly modifies certain data structures.
- Improper validation of input passed to 'bcpowmod' function in 'ext/bcmath/bcmath.c' script.
- Error in 'grapheme_strpos' function in ext/intl/grapheme/grapheme_string.c script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: PHP < 7.1.33, 7.2.x < 7.2.24, 7.3.x < 7.3.11 RCE Vulnerability - Version Check

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a remote code execution (RCE) vulnerability in certain nginx + php-fpm configurations.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     7.1.33
Installation
path / port:       80/tcp
```

Impact

Successful exploitation would allow an unauthenticated remote attacker to execute arbitrary code on the target machine.

Solution:

Solution type: VendorFix

Update to version 7.1.33, 7.2.24, 7.3.11 or later.

As an alternative a workaround to update the nginx configuration to mitigate this vulnerability is described at the PHP.net bugtracker linked in the references.

Affected Software/OS

PHP prior to version 7.1.33, 7.2.x prior to 7.2.24 and 7.3.x prior to 7.3.11.

Vulnerability Insight

The file sapi/fpm/fpm/fpm_main.c contains pointer arithmetic that assumes that env_path_info has a prefix equal to the path to the php script. However, the code does not check this assumption is satisfied. The absence of the check can lead to an invalid pointer in the 'path_info' variable.

Such conditions can be achieved in a pretty standard Nginx configuration. The regexp in 'fastcgi_split_path_info' directive can be broken using the newline character (in encoded form, %0a). Broken regexp leads to empty PATH_INFO, which triggers the bug.

```

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

Successfully exploiting this issue allow remote attackers to cause a denial of service, to obtain sensitive information from process memory, to inject arbitrary-type session data by leveraging control of a session name.

Solution:
Solution type: VendorFix
Update to version 5.6.25, 7.0.10 or later.

Affected Software/OS
PHP prior to version 5.6.25 and 7.x prior to 7.0.10 on Linux.

Vulnerability Insight
The following flaws exist:
- Invalid wddxPacket XML document that is mishandled in a wddx_deserialize call in 'ext/wddx/wddx.c' script.
- Error in 'php_wddx_pop_element' function in 'ext/wddx/wddx.c' script.
- An error in 'php_wddx_process_data' function in 'ext/wddx/wddx.c' script.
- Improper handling of the case of a thumbnail offset that exceeds the file size in 'exif_process_IFD_in_TIFF' function in 'ext/exif/exif.c' script.
- Improper validation of gamma values in 'imagegammacorrect' function in 'ext/gd/gd.c' script.
- Improper validation of number of colors in 'imagegammacorrect' function in 'ext/gd/gd.c' script.
- The script 'ext/session/session.c' skips invalid session names in a way that triggers incorrect parsing.
- Improper handling of certain objects in 'ext/standard/var_unserializer.c' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux

Product detection result
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)

Summary
Apache HTTP Server is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.52
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.52 or later.

Affected Software/OS
Apache HTTP Server versions through 2.4.51.

Vulnerability Insight
A carefully crafted request body can cause a buffer overflow in the mod_lua multipart parser (r:parsebody() called from Lua scripts).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.34
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to cause a denial of service (buffer overflow and application crash) or possibly execute arbitrary code.

Solution:

Solution type: VendorFix

Update to version 5.5.34, 5.6.20, 7.0.5 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
PHP prior to version 5.5.34, 5.6.x prior to 5.6.20 and 7.0.x prior to 7.0.5 on Linux.

Vulnerability Insight
The following flaws exist:
- Multiple integer overflows in the mbfl_strcut function in 'ext/mbstring/libmbfl/mbfl/mbfilter.c' script.
- Format string vulnerability in the php_snmp_error function in 'ext/snmp/snmp.c' script.
- An improper handling of '\0' characters by the 'phar_analyze_path' function in 'ext/phar/phar.c' script.
- An integer overflow in the 'php_raw_url_encode' function in 'ext/standard/url.c' script.
- An improper handling of continuation-level jumps in 'file_check_mem' function in 'funcs.c' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Apache HTTP Server Multiple Vulnerabilities (Jun 2017) - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.26
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow remote attackers to bypass authentication and perform unauthorized actions, cause a denial-of-service condition and gain access to potentially sensitive information.

Solution:

Solution type: VendorFix

. . . continues on next page . . .

. . . continued from previous page . . .

Update to Apache HTTP Server 2.2.33 or 2.4.26 or later.

Affected Software/OS
Apache HTTP Server 2.2.x before 2.2.33 and 2.4.x before 2.4.26.

Vulnerability Insight
Multiple flaws exist as,
- The mod_mime can read one byte past the end of a buffer when sending a malicious Content-Type response header.
- The mod_ssl may dereference a NULL pointer when third-party modules call ap_hook_process_connection() during an HTTP request to an HTTPS port.
- An use of the ap_get_basic_auth_pw() by third-party modules outside of the authentication phase may lead to authentication requirements being bypassed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: PHP < 5.6.26, 7.x < 7.0.11 Multiple Vulnerabilities (Sep 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.26
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to cause a denial of service, or possibly have unspecified other impact.

Solution:

Solution type: VendorFix

Update to version 5.6.26, 7.0.11 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
PHP prior to version 5.6.26 and 7.x prior to 7.0.11 on Linux.

Vulnerability Insight
The following flaws exist:
- Use-after-free vulnerability in the 'wddx_stack_destroy' function in 'ext/wddx/wddx.c' script.
- Improper verification of a BIT field has the UNSIGNED_FLAG flag in 'ext/mysqlnd/mysqlnd_wireprotocol.c' script.
- The ZIP signature-verification feature does not ensure that the uncompressed_filesize field is large enough.
- The script 'ext/spl/spl_array.c' proceeds with SplArray unserialization without validating a return value and data type.
- The script 'ext/intl/msgformat/msgformat_format.c' does not properly restrict the locale length provided to the Locale class in the ICU library.
- An error in the php_wddx_push_element function in ext/wddx/wddx.c.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: PHP 5.x < 5.6.34, 7.x < 7.0.28, 7.1.x < 7.1.15, 7.2.x < 7.2.3 Stack Buffer Overflow Vulnerability (Mar 2018) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a stack buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.34
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow an attacker to execute arbitrary code in the context of the affected application. Failed exploit attempts will result in denial-of-service conditions.

Solution:

Solution type: VendorFix

Update to version 5.6.34, 7.0.28, 7.1.15, 7.2.3 or later.

Affected Software/OS

PHP versions 5.x prior to 5.6.34, 7.x prior to 7.0.28, 7.1.x prior to 7.1.15 and 7.2.x prior to 7.2.3 on Linux.

Vulnerability Insight

The flaw exists because php fails to adequately bounds-check user-supplied data before copying it into an insufficiently sized buffer.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `PHP 5.x < 5.6.34, 7.x < 7.0.28, 7.1.x < 7.1.15, 7.2.x < 7.2.3 Stack Buffer Over.`

Product detection result
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 5.5.9
Fixed version: 5.5.24
Installation
path / port: 80/tcp

Impact
Successfully exploiting these issues allow remote attackers to cause a denial of service, to obtain sensitive information from process memory and to execute arbitrary code via crafted dimensions.

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to version 5.4.40, 5.5.24, 5.6.8 or later.

Affected Software/OS
PHP prior to version 5.4.40, 5.5.x prior to 5.5.24 and 5.6.x prior to 5.6.8.

Vulnerability Insight
The following flaws exist:
- Multiple stack-based buffer overflows in the 'phar_set_inode' function in phar_internal.h script in PHP.
- Vulnerabilities in 'phar_parse_metadata' and 'phar_parse_pharfile' functions in ext/phar/phar.c script in PHP.
- A NULL pointer dereference flaw in the 'build_tablename' function in 'ext/pgsql/pgsql.c' script that is triggered when handling NULL return values for 'token'

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.4.40, 5.5.x < 5.5.24, 5.6.x < 5.6.8 Multiple Vulnerabilities - Linux`

```

Solution:

Solution type: WillNotFix

No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS

PHP versions through 7.1.5.

Vulnerability Insight

The following flaws exist:

- CVE-2017-8923: The zend_string_extend function in Zend/zend_string.h does not prevent changes to string objects that result in a negative length, which allows remote attackers to cause a denial of service (application crash) or possibly have unspecified other impact by leveraging a script's use of .= with a long string.

- CVE-2017-9119: The i_zval_ptr_dtor function in Zend/zend_variables.h allows attackers to cause a denial of service (memory consumption and application crash) or possibly have unspecified other impact by triggering crafted operations on array data structures.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Fixed version:     8.1.31
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.1.31, 8.2.26, 8.3.14 or later.

Affected Software/OS
PHP versions prior to 8.1.31, 8.2.x prior to 8.2.26 and 8.3.x prior to 8.3.14.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2024-8929: Leak partial content of the heap through heap buffer over-read
- CVE-2024-8932: OOB access in ldap_escape
- CVE-2024-11233: Single byte overread with convert.quoted-printable-decode filter
- CVE-2024-11234: Configuring a proxy in a stream context might allow for CRLF injection in URIs
- CVE-2024-11236: Integer overflow in the firebird/dblib quoter causing OOB writes
- No CVE: Heap-Use-After-Free in sapi_read_post_data Processing in CLI SAPI Interface

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

path / port: 80/tcp

Impact
Successfully exploiting these issues allows a remote attacker to cause a DoS, or possibly have unspecified other impact.

Solution:
Solution type: VendorFix
Update to version 5.6.27, 7.0.12 or later.

Affected Software/OS
PHP prior to version 5.6.27 and 7.0.x through 7.0.11.

Vulnerability Insight
The following flaws exist:
- Integer Overflow in gdImageWebpCtx of gd_webp.c
- Use After Free in PHP7 unserialize()

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: PHP < 5.5.27, 5.6.x < 5.6.11 Arbitrary Code Execution Vulnerability (Aug 2016) - Linux

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to an arbitrary code execution vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
`Installed version: 5.5.9`

. . . continues on next page . . .

. . . continued from previous page . . .

```
Fixed version:     5.5.27
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting this issue allow remote attackers to execute arbitrary code by triggering a failed SplMinHeap::compare operation.

Solution:
Solution type: VendorFix
Update to version 5.5.27, 5.6.11 or later.

Affected Software/OS
PHP prior to version 5.5.27 and 5.6.x prior to 5.6.11 on Linux.

Vulnerability Insight
An use-after-free vulnerability occurs in the 'spl_ptr_heap_insert' function in 'ext/spl/spl_heap.c'.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.27, 5.6.x < 5.6.11 Arbitrary Code Execution Vulnerability (Aug 2016) .`

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.37
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to cause a denial of service (buffer overflow and application crash) or possibly execute arbitrary code.

Solution:
Solution type: VendorFix
Update to PHP version 5.5.37, 5.6.23, 7.0.8 or later.

Affected Software/OS
PHP prior to version 5.5.37, 5.6.x prior to 5.6.23 and 7.x prior to 7.0.8 on Linux.

Vulnerability Insight
The following flaws exist:
- The 'php_zip.c' script in the zip extension improperly interacts with the unserialize implementation and garbage collection.
- The php_wddx_process_data function in 'wddx.c' script in the WDDX extension mishandled data in a wddx_deserialize call.
- The multiple integer overflows in 'mcrypt.c' script in the mcrypt extension.
- The double free vulnerability in the '_php_mb_regex_ereg_replace_exec' function in 'php_mbregex.c' script in the mbstring extension.
- An integer overflow in the '_gd2GetHeader' function in 'gd_gd2.c' script in the GD Graphics Library.
- An integer overflow in the 'gdImageCreate' function in 'gd.c' script in the GD Graphics Library.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.37, 5.6.x < 5.6.23, 7.x < 7.0.8 Multiple Vulnerabilities (Aug 2016) -.`

`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.53
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.53 or later.

Affected Software/OS
Apache HTTP Server version 2.4.52 and prior.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2022-22719: mod_lua Use of uninitialized value of in r:parsebody
- CVE-2022-22720: HTTP request smuggling vulnerability
- CVE-2022-22721: Possible buffer overflow with very large or unlimited LimitXMLRequestBody
- CVE-2022-23943: mod_sed: Read/write beyond bounds

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.28
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to cause a denial of service (NULL pointer dereference and application crash) or trigger unintended method execution to defeat cryptographic protection mechanisms.

Solution:

Solution type: VendorFix

Update to version 5.4.44, 5.5.28, 5.6.12 or later.

Affected Software/OS

PHP prior to version 5.4.44, 5.5.x prior to 5.5.28 and 5.6.x prior to 5.6.12 on Linux.

Vulnerability Insight

Multiple flaws exist due to:

- An improper validation of certain Exception objects in 'Zend/zend_exceptions.c' script.

- The 'openssl_random_pseudo_bytes' function in 'ext/openssl/openssl.c' incorrectly relies on the deprecated 'RAND_pseudo_bytes' function.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Installation
path / port:       80/tcp
```

. . . continues on next page . . .

. . . continued from previous page . . .

Impact
Successfully exploiting these issues allow remote attackers to leak information from the interpreter, crash PHP interpreter and also disclose sensitive information.

Solution:
Solution type: VendorFix
Update to version 5.6.31, 7.0.21, 7.1.7 or later.

Affected Software/OS
PHP prior to version 5.6.31, 7.0.x prior to 7.0.21 and 7.1.x prior to 7.1.7.

Vulnerability Insight
The following vulnerabilities exist:
- An ext/date/lib/parse_date.c out-of-bounds read affecting the php_parse_date function.
- The openssl extension PEM sealing code did not check the return value of the OpenSSL sealing function.
- lack of bounds checks in the date extension's timelib_meridian parsing code.
- A stack-based buffer overflow in the zend_ini_do_op() function in the 'Zend/zend_ini_parser.c' script.
- The GIF decoding function gdImageCreateFromGifCtx in gd_gif_in.c in the GD Graphics Library (aka libgd) does not zero colorMap arrays before use.
- Heap buffer overread (READ: 1) finish_nested_data from unserialize
- oniguruma upstream fix

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.31, 7.0.x < 7.0.21, 7.1.x < 7.1.7 Multiple Vulnerabilities (Jul 2017).`

NVT: Apache HTTP Server Multiple Vulnerabilities (Apr 2018) - Linux

Product detection result
`cpe:/a:apache:http_server:2.4.7`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.30
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow an attacker to replay HTTP requests across servers without detection, influence the user content, upload a malicious file, crash the Apache HTTP Server and perform denial of service attack.

Solution:
Solution type: VendorFix
Update to version 2.4.30 or later. Please see the references for more information.

Affected Software/OS
Apache HTTP Server versions from 2.4.1 to 2.4.4, 2.4.6, 2.4.7, 2.4.9, 2.4.10, 2.4.12, 2.4.16 to 2.4.18, 2.4.20, 2.4.23, 2.4.25 to 2.4.29.

Vulnerability Insight
Multiple flaws exist due to:
- Apache HTTP Server fails to correctly generate the nonce sent to prevent reply attacks.
- Misconfigured mod_session variable, HTTP_SESSION.
- Apache HTTP Server fails to sanitize the expression specified in '<FilesMatch>'.
- An error in Apache HTTP Server 'mod_authnz_ldap' when configured with AuthLDAPCharsetConfig.
- Apache HTTP Server fails to sanitize against a specially crafted request.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Apache HTTP Server 2.4.0 - 2.4.46 Multiple Vulnerabilities - Linux

Product detection result
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.48
Installation
path / port:       80/tcp
```

Impact

- CVE-2020-35452: A specially crafted Digest nonce can cause a stack overflow in mod_auth_digest.
- CVE-2021-26690: A specially crafted Cookie header handled by mod_session can cause a NULL pointer dereference and crash, leading to a possible Denial Of Service.
- CVE-2021-26691: A specially crafted SessionHeader sent by an origin server could cause a heap overflow.

Solution:
Solution type: VendorFix
Update to version 2.4.48 or later.

Affected Software/OS
Apache HTTP Server versions 2.4.0 to 2.4.46 on Linux.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2020-35452: mod_auth_digest possible stack overflow by one null byte
- CVE-2021-26690: mod_session NULL pointer dereference
- CVE-2021-26691: mod_session response handling heap overflow

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 2.4.0 - 2.4.46 Multiple Vulnerabilities - Linux`

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     None
Installation
path / port:       80/tcp
```

Solution:

. . . continues on next page . . .

. . . continued from previous page . . .

Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
PHP versions through 5.6.27 and 7.0.x through 7.0.12.

Vulnerability Insight
PHP mishandles property modification during __wakeup processing, which allows remote attackers to cause a denial of service or possibly have unspecified other impact via crafted serialized data, as demonstrated by Exception::__toString with DateInterval::__wakeup.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP <= 5.6.27 / 7.0.x <= 7.0.12 DoS Vulnerability`

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.32
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to cause a denial of service (heap memory corruption) or possibly have unspecified other impact.

Solution:

Solution type: VendorFix

Update to version 5.5.32, 5.6.18, 7.0.3 or later.

Affected Software/OS

PHP prior to version 5.5.32, 5.6.x prior to 5.6.18 and 7.x prior to 7.0.3 on Linux.

Vulnerability Insight

The following flaws exist:

- CVE-2016-2554: Stack-based buffer overflow in ext/phar/tar.c
- CVE-2016-4342: ext/phar/phar_object.c mishandles zero-length uncompressed data

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.37
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to cause a denial of service (use-after-free and application crash) or possibly execute arbitrary code or possibly have unspecified other impact via a large integer argument.

Solution:

Solution type: VendorFix

Update to version 5.5.37, 5.6.23 or later.

Affected Software/OS

PHP prior to version 5.5.37 and 5.6.x prior to 5.6.23 on Linux.

Vulnerability Insight

The following flaws exist:

- The 'spl_array.c' in the SPL extension improperly interacts with the unserialize implementation and garbage collection.

- Integer overflow in the 'SplFileObject::fread' function in 'spl_directory.c' in the SPL extension.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.29
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to read arbitrary empty directories, also to cause a denial of service.

Solution:

Solution type: VendorFix

Update to version 5.4.45, 5.5.29, 5.6.13 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
PHP prior to version 5.4.45, 5.5.x prior to 5.5.29 and 5.6.x prior to 5.6.13 on Linux.

Vulnerability Insight
The following flaws exist:
- Error in the 'ZipArchive::extractTo' function in 'ext/zip/php_zip.c' script.
- The xsl_ext_function_php function in ext/xsl/xsltprocessor.c when libxml2 is used, does not consider the possibility of a NULL valuePop return value before proceeding with a free operation after the principal argument loop.
- Improper handling of multiple php_var_unserialize calls
- Multiple use-after-free vulnerabilities

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: PHP < 5.4.43, 5.5.x < 5.5.27, 5.6.x < 5.6.11 Multiple Vulnerabilities (Mar 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.27
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to execute arbitrary code in the context of the PHP process. Failed exploit attempts will likely crash the webserver.

Solution:

Solution type: VendorFix

Update to version 5.4.43, 5.5.27, 5.6.11 or later.

Affected Software/OS

PHP prior to version 5.4.43, 5.5.x prior to 5.5.27 and 5.6.x prior to 5.6.11 on Linux.

Vulnerability Insight

The following flaws exist:

. . . continues on next page . . .

. . . continued from previous page . . .

- Inadequate boundary checks on user-supplied input by 'phar_fix_filepath' function in 'ext/phar/phar.c' script.
- Improper validation of file pointer in the 'phar_convert_to_other' function in 'ext/phar/phar_object.c' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.4.43, 5.5.x < 5.5.27, 5.6.x < 5.6.11 Multiple Vulnerabilities (Mar 2016. ↪..`

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a use-after-free vulnerability in a used third-pary library.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     7.1.32
Installation
path / port:       80/tcp
```

Impact

This flaw allows attackers to potentially cause information disclosure, denial of service, or possibly code execution by providing a crafted regular expression.

Solution:

Solution type: VendorFix

Update to version 7.1.32, 7.3.9 or later.

Affected Software/OS

PHP version before 7.1.32 and 7.3.x before 7.3.9.

Vulnerability Insight

The flaw exists due to a use-after-free in onig_new_deluxe() in regext.c of the third-party library Oniguruma 6.9.2 which is used by PHP.

The attacker provides a pair of a regex pattern and a string, with a multi-byte encoding that gets handled by onig_new_deluxe().

Update to version 8.1.29, 8.2.20, 8.3.8 or later.

Affected Software/OS
PHP prior to version 8.1.29, version 8.2.x through 8.2.19 and 8.3.x through 8.3.7.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2024-4577: Argument injection in PHP-CGI (bypass of CVE-2012-1823)
- CVE-2024-5458: Filter bypass in filter_var FILTER_VALIDATE_URL
- CVE-2024-5585: Bypass of CVE-2024-1874
Note: As of 06/2024 the CVEs CVE-2024-4577 and CVE-2024-5585 are known to be exploitable on Windows systems only.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: PHP < 8.1.29, 8.2.x < 8.2.20, 8.3.x < 8.3.8 Multiple Vulnerabilities - Linux

Critical (CVSS: 9.8)
NVT: Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a HTTP request smuggling vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.56
Installation
path / port:       80/tcp
```

Impact

Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

Solution:

Solution type: VendorFix

Update to version 2.4.56 or later.

Affected Software/OS

. . . continues on next page . . .

. . . continued from previous page . . .

Apache HTTP Server versions 2.4.0 through 2.4.55.

Vulnerability Insight
Some mod_proxy configurations allow a HTTP Request Smuggling attack.
Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux`

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     8.1.32
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.1.32, 8.2.28 or later.

Affected Software/OS
PHP versions prior to 8.1.32, and 8.2.x prior to 8.2.28.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2025-1217: Header parser of 'http' stream wrapper does not handle folded headers
- CVE-2025-1219: libxml streams use wrong 'content-type' header when requesting a redirected resource
- CVE-2025-1734: Streams HTTP wrapper does not fail for headers without colon
- CVE-2025-1736: Stream HTTP wrapper header check might omit basic auth header
- CVE-2025-1861: Stream HTTP wrapper truncate redirect location to 1024 bytes

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 8.1.32, 8.2.x < 8.2.28 Multiple Vulnerabilities - Linux`

Critical (CVSS: 9.6)
NVT: PHP < 5.5.22, 5.6.x < 5.6.6 XXE Vulnerability - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to an XML external entity (XXE) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.22
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to conduct XML External Entity (XXE) and XML Entity Expansion (XEE) attacks.

Solution:

Solution type: VendorFix

Update to PHP version 5.5.22, 5.6.6 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
PHP prior to version 5.5.22 and 5.6.x prior to 5.6.6 on Linux.

Vulnerability Insight
The flaw is due to script 'ext/libxml/libxml.c' does not isolate each thread from 'libxml_disable_entity_loader' when PHP-FPM is used.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.22, 5.6.x < 5.6.6 XXE Vulnerability - Linux`

NVT: Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.27
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow remote attackers to cause the target service to crash. A remote user can obtain potentially sensitive information as well on the target system.

Solution:

Solution type: VendorFix

Update to Apache HTTP Server 2.2.34 or 2.4.27 or later.

Affected Software/OS

Apache HTTP Server 2.2.x before 2.2.34 and 2.4.x before 2.4.27.

Vulnerability Insight

The flaw exists due to error in Apache 'mod_auth_digest' which does not properly initialize memory used to process 'Digest' type HTTP Authorization headers.

Vulnerability Detection Method

. . . continues on next page . . .

. . . continued from previous page . . .

Checks if a vulnerable version is present on the target host.

Summary

PHP is prone to an out-of-bounds read memory corruption vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.31
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to obtain sensitive information or cause a denial-of-service condition.

Solution:

Solution type: VendorFix

Update to version 5.5.31, 5.6.17, 7.0.2 or later.

Affected Software/OS

PHP prior to version 5.5.31, 5.6.x prior to 5.6.17 and 7.x prior to 7.0.2 on Linux.

Vulnerability Insight

A memory corruption vulnerability occurs via a large 'bgd_color' argument to the 'imagerotate' function in 'ext/gd/libgd/gd_interpolation.c' script.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Product detection result
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 5.5.9
Fixed version: 5.5.31
Installation
path / port: 80/tcp

Impact
Successfully exploiting this issue allow attackers to obtain sensitive information from process memory or cause a denial of service (out-of-bounds read and buffer overflow) via a long string.

Solution:
Solution type: VendorFix
Update to version 5.5.31, 5.6.17, 7.0.2 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
PHP prior to version 5.5.31, 5.6.x prior to 5.6.17 and 7.x prior to 7.0.2 on Linux.

Vulnerability Insight
The flaw is due to the 'sapi/fpm/fpm/fpm_log.c' script misinterprets the semantics of the snprintf return value.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.55
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.55 or later.

Affected Software/OS
Apache HTTP Server version 2.4.54 and prior.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2006-20001: mod_dav out of bounds read, or write of zero byte
- CVE-2022-36760: Possible request smuggling in mod_proxy_ajp
- CVE-2022-37436: mod_proxy allows a backend to trigger HTTP response splitting

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server < 2.4.55 Multiple Vulnerabilities - Linux`
OID:1.3.6.1.4.1.25623.1.0.149152
Version used: `2024-02-15T05:05:40Z`

Product Detection Result
Product: `cpe:/a:apache:http_server:2.4.7`
Method: `Apache HTTP Server Detection Consolidation`
OID: 1.3.6.1.4.1.25623.1.0.117232)

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     8.1.30
Installation
path / port:       443/tcp
```

Solution:

Solution type: VendorFix

Update to version 8.1.30, 8.2.24, 8.3.12 or later.

Affected Software/OS

PHP versions prior to 8.1.30, 8.2.x prior to 8.2.24 and 8.3.x prior to 8.3.12.

Vulnerability Insight

The following vulnerabilities exist:

- CVE-2024-8925, CVE-2024-8928: Erroneous parsing of multipart form data
- CVE-2024-8926: Bypass of CVE-2024-4577, Parameter Injection Vulnerability

. . . continues on next page . . .

. . . continued from previous page . . .

- CVE-2024-8927: cgi.force_redirect configuration is bypassable due to the environment variable collision
- CVE-2024-9026: Logs from children may be altered

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.36
Installation
path / port:       443/tcp
```

Impact
Successful exploitation will allow an attacker to conduct XSS attacks, crash PHP, conduct denial of service condition and execute arbitrary code in the context of the affected application.

Solution:
Solution type: VendorFix
Update to version 5.6.36, 7.0.30, 7.1.17, 7.2.5 or later.

Affected Software/OS
PHP prior to version 5.6.36, 7.0.x prior to 7.0.30, 7.1.x prior to 7.1.17 and 7.2.x prior to 7.2.5 on Linux.

Vulnerability Insight
The following flaws exist:
- CVE-2018-10549: Out of bounds read error in 'exif_read_data' function while processing crafted JPG data.
- CVE-2018-10546: An error in stream filter 'convert.iconv' which leads to infinite loop on invalid sequence.
- CVE-2018-10548: An error in the LDAP module of PHP which allows a malicious LDAP server or man-in-the-middle attacker to crash PHP.
- CVE-2018-10547: An error in the 'phar_do_404()' function in 'ext/phar/phar_object.c' script which returns parts of the request unfiltered, leading to another XSS vector. This is due to incomplete fix for CVE-2018-5712.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.36, 7.x < 7.0.30, 7.1.x < 7.1.17, 7.2.x < 7.2.5 Multiple Vulnerabilit.`

NVT: PHP < 5.6.18, 7.x < 7.0.3 DoS Vulnerability (Jul 2016) - Linux

Product detection result
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 5.5.9
Fixed version: 5.6.18
Installation
path / port: 443/tcp

Impact
Successfully exploiting this issue allow remote attackers to cause a denial of service (heap memory corruption) or possibly have unspecified other impact.

Solution:
Solution type: VendorFix
Update to version 5.6.18, 7.0.3 or later.

Affected Software/OS
PHP prior to version 5.6.18 and 7.x prior to 7.0.3 on Linux.

Vulnerability Insight
The flaw is due an improper handling of zero-size '././@LongLink' files by 'phar_make_dirstream' function in ext/phar/dirstream.c script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: PHP < 5.6.18, 7.x < 7.0.3 DoS Vulnerability (Jul 2016) - Linux

cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.52
Installation
path / port:       443/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.52 or later.

Affected Software/OS
Apache HTTP Server version 2.4.7 through 2.4.51.

Vulnerability Insight
A crafted URI sent to httpd configured as a forward proxy (ProxyRequests on) can cause a crash (NULL pointer dereference) or, for configurations mixing forward and reverse proxy declarations, can allow for requests to be directed to a declared Unix Domain Socket endpoint (Server Side Request Forgery).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     8.2.30
Installation
path / port:       443/tcp
```

Solution:

Solution type: VendorFix

Update to version 8.2.30, 8.3.29, 8.4.16 or later.

Affected Software/OS

PHP versions prior to 8.2.30, 8.3.x prior to 8.3.29 and 8.4.x prior to 8.4.16.

Vulnerability Insight

The following flaws exist:

- CVE-2025-14177: Information leak of memory in getimagesize
- CVE-2025-14178: Heap buffer overflow in array_merge()
- CVE-2025-14180: PDO quoting result null deref
- No CVE: Null byte termination in dns_get_record()

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `PHP < 8.2.30, 8.3.x < 8.3.29, 8.4.x < 8.4.16 Multiple Vulnerabilities - Linux`

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.36
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow an attacker to conduct XSS attacks, crash PHP, conduct denial of service condition and execute arbitrary code in the context of the affected application.

Solution:

Solution type: VendorFix

Update to version 5.6.36, 7.0.30, 7.1.17, 7.2.5 or later.

Affected Software/OS

PHP prior to version 5.6.36, 7.0.x prior to 7.0.30, 7.1.x prior to 7.1.17 and 7.2.x prior to 7.2.5 on Linux.

Vulnerability Insight

The following flaws exist:

- CVE-2018-10549: Out of bounds read error in 'exif_read_data' function while processing crafted JPG data.

. . . continues on next page . . .

. . . continued from previous page . . .

- CVE-2018-10546: An error in stream filter 'convert.iconv' which leads to infinite loop on invalid sequence.
- CVE-2018-10548: An error in the LDAP module of PHP which allows a malicious LDAP server or man-in-the-middle attacker to crash PHP.
- CVE-2018-10547: An error in the 'phar_do_404()' function in 'ext/phar/phar_object.c' script which returns parts of the request unfiltered, leading to another XSS vector. This is due to incomplete fix for CVE-2018-5712.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `PHP < 5.6.36, 7.x < 7.0.30, 7.1.x < 7.1.17, 7.2.x < 7.2.5 Multiple Vulnerabilit. ↪..`

Product detection result

`cpe:/a:php:php:5.5.9`

`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.18
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to cause a denial of service (heap memory corruption) or possibly have unspecified other impact.

Solution:

Solution type: VendorFix

Update to version 5.6.18, 7.0.3 or later.

Affected Software/OS

PHP prior to version 5.6.18 and 7.x prior to 7.0.3 on Linux.

Vulnerability Insight

The flaw is due an improper handling of zero-size '././@LongLink' files by 'phar_make_dirstream' function in ext/phar/dirstream.c script.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `PHP < 5.6.18, 7.x < 7.0.3 DoS Vulnerability (Jul 2016) - Linux`

Apache HTTP Server version 2.4.7 through 2.4.51.

Vulnerability Insight
A crafted URI sent to httpd configured as a forward proxy (ProxyRequests on) can cause a crash (NULL pointer dereference) or, for configurations mixing forward and reverse proxy declarations, can allow for requests to be directed to a declared Unix Domain Socket endpoint (Server Side Request Forgery).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 2.4.7 - 2.4.51 Multiple Vulnerabilities - Linux`
OID:1.3.6.1.4.1.25623.1.0.117854
Version used: `2021-12-23T12:12:57Z`

Product Detection Result
Product: `cpe:/a:apache:http_server:2.4.7`
Method: `Apache HTTP Server Detection Consolidation`
OID: 1.3.6.1.4.1.25623.1.0.117232)

NVT: Nginx End of Life (EOL) Detection

Product detection result

```
cpe:/a:f5:nginx:1.14.2
Detected by nginx Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.113787)
```

Summary

The Nginx version on the remote host has reached the End of Life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
The "Nginx" version on the remote host has reached the end of life.
CPE:                cpe:/a:nginx:nginx:1.14.2
Installed version:  1.14.2
Location/URL:       80/tcp
EOL version:        1.14
EOL date:           2019-04-23
```

Impact

An EOL version of Nginx is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:

Solution type: VendorFix

Update the Nginx version on the remote host to a still supported version.

Vulnerability Detection Method

Checks if an EOL version is present on the target host.

Details: `Nginx End of Life (EOL) Detection`

OID:1.3.6.1.4.1.25623.1.0.148940

Version used: `2025-04-15T05:54:49Z`

cpe:/a:apache:tomcat:7.0.70
Detected by Apache Tomcat Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.10
↪7652)
```

Summary

Apache Tomcat is prone to a security bypass vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.70
Fixed version:     7.0.89
Installation
path / port:       8080/tcp
```

Impact

Successful exploitation will allow remote attackers to bypass certain security restrictions and perform unauthorized actions. This may aid in further attacks.

Solution:

Solution type: VendorFix

Upgrade to Apache Tomcat version 9.0.9, 8.0.53, 7.0.89 or 8.5.32 or later. Please see the references for more information.

Affected Software/OS

Apache Tomcat versions 9.0.0.M1 to 9.0.8 Apache Tomcat versions 8.5.0 to 8.5.31 Apache Tomcat versions 8.0.0.RC1 to 8.0.52 Apache Tomcat versions 7.0.41 to 7.0.88

Vulnerability Insight

The flaw exists because defaults settings for the CORS filter provided in Apache Tomcat are insecure and enable 'supportsCredentials' for all origins.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

NVT: Apache Tomcat RCE Vulnerability (Nov 2016)

Product detection result
cpe:/a:apache:tomcat:7.0.70
Detected by Apache Tomcat Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.10
↪7652)

Summary
Apache Tomcat is prone to a remote code execution (RCE) vulnerability.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.70
Fixed version:     7.0.73
Installation
path / port:       8080/tcp
```

Impact

Successful exploitation will allow remote attackers to execute arbitrary code.

Solution:

Solution type: VendorFix

Update to version 6.0.48, 7.0.73, 8.0.39, 8.5.8, 9.0.0.M13 or later.

Affected Software/OS

Apache Tomcat before 6.0.48, 7.x before 7.0.73, 8.x before 8.0.39, 8.5.x before 8.5.7, and 9.x before 9.0.0.M12.

Note: This issue exists if JmxRemoteLifecycleListener is used and an attacker can reach JMX ports.

Vulnerability Insight

The flaw is due to an unspecified error in 'JmxRemoteLifecycleListener'.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Summary
Apache Tomcat is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.70
Fixed version:     7.0.100
Installation
path / port:       8080/tcp
```

Solution:
Solution type: VendorFix
Update to version 7.0.100, 8.5.51, 9.0.31 or later.

Affected Software/OS
Apache Tomcat 7.0.0 to 7.0.99, 8.5.0 to 8.5.50 and 9.0.0.M1 to 9.0.30.

Vulnerability Insight
Apache Tomcat is prone to multiple vulnerabilities:
- HTTP request smuggling vulnerability (CVE-2020-1935)
- AJP Request Injection and potential Remote Code Execution dubbed 'Ghostcat' (CVE-2020-1938)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Apache Tomcat Rewrite Rule Bypass Vulnerability (Apr 2025) - Linux

Product detection result

```
cpe:/a:apache:tomcat:7.0.70
Detected by Apache Tomcat Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.10
↪7652)
```

Summary

Apache Tomcat is prone to a rewrite rule bypass vulnerability.

Quality of Detection (QoD): 30%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Installed version: 7.0.70
Fixed version:     9.0.104
Installation
path / port:       8080/tcp
```

Solution:
Solution type: VendorFix
Update to version 9.0.104, 10.1.40, 11.0.6 or later.

Affected Software/OS
Apache Tomcat version 9.0.102 and prior, 10.x through 10.1.39 and 11.0.0-M1 through 11.0.5. Note: While not explicitly mentioned by the vendor (due to the EOL status of these branches) it is assumed that the whole 10.x branch and all versions prior to 9.x are affected by these flaws. If you disagree with this assessment and want to accept the risk please create an override for this result.

Vulnerability Insight
For a subset of unlikely rewrite rule configurations, it is possible for a specially crafted request to bypass some rewrite rules. If those rewrite rules effectively enforced security constraints, those constraints could be bypassed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache Tomcat Rewrite Rule Bypass Vulnerability (Apr 2025) - Linux`

NVT: Apache Tomcat RCE Vulnerability (Mar 2025) - Linux

Product detection result

```
cpe:/a:apache:tomcat:7.0.70
Detected by Apache Tomcat Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.10
↪7652)
```

Summary

Apache Tomcat is prone to a remote code execution (RCE) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.70
Fixed version:     9.0.99
Installation
path / port:       8080/tcp
```

Solution:

Solution type: VendorFix

Update to version 9.0.99, 10.1.35, 11.0.3 or later.

Affected Software/OS

Apache Tomcat version 9.0.98 and prior, 10.x through 10.1.34 and 11.0.0-M1 through 11.0.2. Note: While not explicitly mentioned by the vendor (due to the EOL status of these branches) it is assumed that the whole 10.x branch and all versions prior to 9.x are affected by these flaws. If you disagree with this assessment and want to accept the risk please create an override for this result.

Vulnerability Insight

The original implementation of partial PUT used a temporary file based on the user provided file name and path with the path separator replaced by '.'.

. . . continues on next page . . .

. . . continued from previous page . . .

If all of the following are true, a malicious user is able to view security sensitive files and/or inject content into those files:
- writes enabled for the default servlet (disabled by default)
- support for partial PUT (enabled by default)
- a target URL for security sensitive uploads that is a sub-directory of a target URL for public uploads
- attacker knowledge of the names of security sensitive files being uploaded
- the security sensitive files also being uploaded via partial PUT

If all of the following are true, a malicious user is able to perform remote code execution:
- writes enabled for the default servlet (disabled by default)
- support for partial PUT (enabled by default)
- application is using Tomcat's file based session persistence with the default storage location
- application includes a library that may be leveraged in a deserialization attack

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Apache Tomcat 'SecurityManager' Information Disclosure Vulnerability (Apr 2017) - Linux

Product detection result

```
cpe:/a:apache:tomcat:7.0.70
Detected by Apache Tomcat Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.10
↪7652)
```

Summary

Apache Tomcat is prone to an information disclosure vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.70
Fixed version:     7.0.76
Installation
path / port:       8080/tcp
```

Impact

Successful exploitation will allow remote attackers to obtain sensitive information from requests other than their own.

Solution:

Solution type: VendorFix

Upgrade to version 9.0.0.M18, 8.5.12, 8.0.42, 7.0.76 or later.

Affected Software/OS

Apache Tomcat versions 9.0.0.M1 to 9.0.0.M17,
Apache Tomcat versions 8.5.0 to 8.5.11,
Apache Tomcat versions 8.0.0.RC1 to 8.0.41 and
Apache Tomcat versions 7.0.0 to 7.0.75 on Linux.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

A some calls to application listeners did not use the appropriate facade object. When running an untrusted application under a SecurityManager, it was therefore possible for that untrusted application to retain a reference to the request or response object and thereby access and/or modify information associated with another web application.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache Tomcat 'SecurityManager' Information Disclosure Vulnerability (Apr 2017).`

NVT: Apache Tomcat Security Bypass and Information Disclosure Vulnerabilities - Linux

Product detection result
`cpe:/a:apache:tomcat:7.0.70`
`Detected by Apache Tomcat Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.10`
`↪7652)`

. . . continues on next page . . .

. . . continued from previous page . . .

Summary
Apache Tomcat is prone to security bypass and information disclosure vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.70
Fixed version:     7.0.72
Installation
path / port:       8080/tcp
```

Impact
Successful exploitation will allow remote attackers to gain access to potentially sensitive information and bypass certain security restrictions.

Solution:
Solution type: VendorFix
Upgrade to Apache Tomcat version 9.0.0.M10 or 8.5.5 or 8.0.37 or 7.0.72 or 6.0.47 or later.

Affected Software/OS
Apache Tomcat versions 9.0.0.M1 to 9.0.0.M9, Apache Tomcat versions 8.5.0 to 8.5.4, Apache Tomcat versions 8.0.0.RC1 to 8.0.36, Apache Tomcat versions 7.0.0 to 7.0.70, and Apache Tomcat versions 6.0.0 to 6.0.45 on Linux.

Vulnerability Insight
Multiple flaws exist due to:
- An error in the system property replacement feature for configuration files.
- An error in the realm implementations in Apache Tomcat that does not process the supplied password if the supplied user name did not exist.
- An error in the configured SecurityManager via a Tomcat utility method that is accessible to web applications.
- An error in the configured SecurityManager via manipulation of the configuration parameters for the JSP Servlet.
- An error in the ResourceLinkFactory implementation in Apache Tomcat that does not limit web application access to global JNDI resources to those resources explicitly linked to the web application.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

```

Solution:
Solution type: VendorFix
- Update Apache Tomcat to version 7.0.100, 8.5.51, 9.0.31 or later
- For other products using Tomcat please contact the vendor for more information on fixed versions

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
Apache Tomcat versions prior 7.0.100, 8.5.51 or 9.0.31 when the AJP connector is enabled. Other products like JBoss or Wildfly which are using Tomcat might be affected as well.

Vulnerability Insight
Apache Tomcat server has a file containing vulnerability, which can be used by an attacker to read or include any files in all webapp directories on Tomcat, such as webapp configuration files or source code.

Vulnerability Detection Method
Sends a crafted AJP request and checks the response.

NVT: phpMyAdmin End of Life (EOL) Detection - Linux

Summary
The phpMyAdmin version on the remote host has reached the End of Life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "phpMyAdmin" version on the remote host has reached the end of life.
CPE:                cpe:/a:phpmyadmin:phpmyadmin:4.6.6
Installed version:  4.6.6
Location/URL:       /
EOL version:        4.6
EOL date:           2017-04-01
```

Impact
An EOL version of phpMyAdmin is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: VendorFix
Update the phpMyAdmin version on the remote host to a still supported version.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Method
Checks if an EOL version is present on the target host.

NVT: phpMyAdmin < 4.9.6, 5.x < 5.0.3 Multiple Vulnerabilities (PMASA-2020-5, PMASA-2020-6) - Linux

Summary
phpMyAdmin is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 4.6.6
Fixed version:     4.9.6
Installation
path / port:       /
```

Impact
Successful exploitation would allow an attacker to:

. . . continues on next page . . .

. . . continued from previous page . . .

- If an attacker sends a crafted link to the victim with the malicious JavaScript, when the victim clicks on the link, the JavaScript will run and complete the instructions made by the attacker (CVE-2020-26934)
- An attacker could use this flaw to inject malicious SQL in to a query (CVE-2020-26935)

Solution:
Solution type: VendorFix
Update to version 4.9.6, 5.0.3 or later.

Affected Software/OS
phpMyAdmin prior to version 4.9.6 and 5.x prior to 5.0.3.

Vulnerability Insight
The following vulnerabilities exist:
- XSS relating to the transformation feature (CVE-2020-26934)
- SQL injection vulnerability in SearchController (CVE-2020-26935)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `phpMyAdmin < 4.9.6, 5.x < 5.0.3 Multiple Vulnerabilities (PMASA-2020-5, PMASA-2.`

```
Fixed version:     4.9.2
Installation
path / port:       /
```

Solution:
Solution type: VendorFix
Update to version 4.9.2 or later.

Affected Software/OS
phpMyAdmin prior to version 4.9.2.

Vulnerability Insight
phpMyAdmin is prone to multiple vulnerabilities:
- SQL injection vulnerability (CVE-2019-18622)
- Certain Git information is not escaped (CVE-2019-19617)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `phpMyAdmin < 4.9.2 Multiple Vulnerabilities (PMASA-2019-5) - Linux`
OID:1.3.6.1.4.1.25623.1.0.143167
Version used: `2024-02-13T05:06:26Z`

[return to 172.30.26.1]

2.20.2 High 80/tcp

High (CVSS: 8.8)
NVT: phpMyAdmin <= 5.1.1 CSV Injection Vulnerability - Linux

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

phpMyAdmin is prone to a CSV injection vulnerability via Export Section.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 4.6.6
Fixed version:     None
Installation
path / port:       /
```

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
phpMyAdmin version 5.1.1 and prior.

Vulnerability Insight
NOTE: the vendor disputes this because 'the CSV file is accurately generated based on the database contents.'
Nevertheless the vendor could implement measures while doing the CSV export which could lower or mitigate the risk originating from this flaw.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `phpMyAdmin <= 5.1.1 CSV Injection Vulnerability - Linux`
OID:1.3.6.1.4.1.25623.1.0.144898
Version used: `2023-10-17T05:05:34Z`

`↪f`

High (CVSS: 8.8)
NVT: phpMyAdmin < 4.9.4, 5.x < 5.0.1 SQL Injection Vulnerability (PMASA-2020-1) - Linux

Summary
phpMyAdmin is prone to an SQL injection vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

. . . continues on next page . . .

. . . continued from previous page . . .

```
Installed version: 4.6.6
Fixed version:     4.9.4
Installation
path / port:       /
```

Impact
A malicious user could inject custom SQL in place of their own username when creating queries to this page. An attacker must have a valid MySQL account to access the server.

Solution:
Solution type: VendorFix
Update to version 4.9.4, 5.0.1 or later.

Affected Software/OS
phpMyAdmin prior to version 4.9.4 and 5.x prior to 5.0.1.

Vulnerability Insight
An SQL injection flaw has been discovered in the user accounts page.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `phpMyAdmin < 4.9.4, 5.x < 5.0.1 SQL Injection Vulnerability (PMASA-2020-1) - Li.`

NVT: Elastic Kibana End of Life (EOL) Detection

Summary
The Elastic Kibana version on the remote host has reached the End of Life (EOL) and should not be used anymore.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The "Elastic Kibana" version on the remote host has reached the end of life.
CPE:                cpe:/a:elastic:kibana:4.6.6
Installed version:  4.6.6
EOL version:        4.6
EOL date:           2018-02-28
```

Impact
An EOL version of Elastic Kibana is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: VendorFix
Update Elastic Kibana to a version that still receives technical support and updates.

Vulnerability Detection Method
Checks if an EOL version is present on the target host.
Details: `Elastic Kibana End of Life (EOL) Detection`
OID:1.3.6.1.4.1.25623.1.0.113130
Version used: `2025-09-03T14:11:39Z`

References
`url: https://www.elastic.co/support/eol`

Critical (CVSS: 10.0)
NVT: Elastic Kibana < 5.6.15, 6.x.x < 6.6.1 Multiple Vulnerabilities - Linux

Summary
Kibana is prone to multiple vulnerabilities.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 4.6.6
Fixed version:     5.6.15
Installation
path / port:       /
```

Impact

Successful exploitation would allow an attacker to obtain sensitive information from or perform destructive actions on behalf of other Kibana users.
Furthermore an attacker with access to the Timelion application could send a request that will attempt to execute javascript code. This could possibly lead to an attacker executing arbitrary commands with permissions of the Kibana process on the host system.
Additionally if a Kibana instance has the setting xpack.security.audit.enabled set to true, an attacker could send a request that will attempt to execute javascript code. This could possibly lead to an attacker executing arbitrary commands with permissions of the Kibana process on the host system.

Solution:
Solution type: VendorFix
Update to version 5.6.15 or 6.6.1 respectively.

Affected Software/OS

Kibana versions before 5.6.15 and 6.0.0 before 6.6.1.

Vulnerability Insight

The following vulnerabilities exist:
- A cross-site scripting (XSS) vulnerability (CVE-2019-7608).
- An arbitrary code execution flaw in the Timelion visualizer (CVE-2019-7609).
- An arbitrary code execution flaw in the security audit logger (CVE-2019-7610).
On May 07, 2021 the NCSC, CISA, FBI and NSA publish advice on detection and mitigation of SVR activity following the attribution of the SolarWinds compromise. This VT is covering one or more vulnerabilities mentioned in that report.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.
Details: `Elastic Kibana < 5.6.15, 6.x.x < 6.6.1 Multiple Vulnerabilities - Linux`
OID:1.3.6.1.4.1.25623.1.0.112543

Critical (CVSS: 9.8)
NVT: Elastic Kibana < 6.8.7, 7.x < 7.6.1 Multiple Vulnerabilities in Node.js (ESA-2020-01) - Linux

Summary
Kibana is prone to multiple vulnerabilities in the shipped 3rdparty Node.js component.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 4.6.6
Fixed version:     6.8.6
Installation
path / port:       /
```

Solution:
Solution type: VendorFix
Update to version 6.8.7, 7.6.1 or later.

Affected Software/OS
Kibana versions prior to 6.8.7 and 7.6.1.

Vulnerability Insight
The version of Node.js shipped in Kibana contain three security flaws:
- CVE-2019-15604 describes a Denial of Service (DoS) flaw in the TLS handling code of Node.js. Successful exploitation of this flaw could result in Kibana crashing.
- CVE-2019-15606 and CVE-2019-15605 describe flaws in how Node.js handles malformed HTTP headers. These malformed headers could result in a HTTP request smuggling attack when Kibana is running behind a proxy vulnerable to HTTP request smuggling attacks.
This update upgrades Node.js to version 10.19.0, which is not vulnerable to these issues.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Elastic Kibana < 6.8.7, 7.x < 7.6.1 Multiple Vulnerabilities in Node.js (ESA-20.`

NVT: Elastic Kibana Node.js Security Vulnerabilities (ESA-2021-24)

Summary
Elastic Kibana is prone to multiple vulnerabilities in Node.js.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
Installed version: 4.6.6
Fixed version:     7.14.1
Installation
path / port:       /
```

Solution:
Solution type: VendorFix
Update to version 7.14.1 or later.

Affected Software/OS
Elastic Kibana version 7.14.0 and prior.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
Node.js version 14.17.3 is affected by several security vulnerabilities: CVE-2021-22940, CVE-2021-3672, CVE-2021-22931, and CVE-2021-22939. We do not believe an attacker can exploit these against Kibana, but we are upgrading Node.js out of an abundance of caution. Kibana 7.14.1 upgrades Node.js to version 14.17.5 to resolve these issues.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Elastic Kibana Node.js Security Vulnerabilities (ESA-2021-24)`

NVT: Elastic Kibana < 6.8.2, 7.x < 7.2.1 Multiple Vulnerabilities (ESA-2019-09, ESA-2019-10) - Linux

Summary
Kibana is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 4.6.6
Fixed version:     6.8.2
Installation
path / port:       /
```

Impact
- CVE-2019-7616: This could possibly lead to an attacker accessing external URL resources as the Kibana process on the host system. Successful exploitation would allow an attacker to read sensitive information.
- CVE-2019-10744: Prototype pollution can be leveraged to execute a cross-site-scripting (XSS), denial of service (DoS), or Remote Code Execution attack against Kibana.

Solution:
Solution type: VendorFix
Update to version 6.8.2 or 7.2.1 respectively.

Affected Software/OS
Kibana through version 6.8.1 and version 7.0.0 through 7.2.0.

Vulnerability Insight
The following vulnerabilities exist:
- A server side request forgery (SSRF) flaw in the graphite integration for Timelion visualizer. An attacker with administrative Kibana access could set the timelion:graphite.url configuration option to an arbitrary URL. (CVE-2019-7616)
- A prototype pollution flaw exists in lodash, a component used by KIbana. An attacker with access to Kibana may be able to use this lodash flaw to unexpectedly modify internal Kibana data. (CVE-2019-10744)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Elastic Kibana < 6.8.2, 7.x < 7.2.1 Multiple Vulnerabilities (ESA-2019-09, ESA-.`

2.21.2 High 5601/tcp

High (CVSS: 8.7)
NVT: Elastic Kibana < 6.8.14, 7.0.0 < 7.10.2 Vega XSS Vulnerability (ESA-2021-04) - Linux

Summary
Kibana is prone to a cross-site scripting vulnerability in Vega visualization.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 4.6.6
Fixed version:     6.8.14
Installation
path / port:       /
```

Impact
Users who can create these visualizations or craft a vulnerable URL describing this visualization can execute arbitrary JavaScript in the victim's browser.

Solution:
Solution type: VendorFix
Update to version 6.8.14, 7.10.2 or later.

Affected Software/OS
Kibana versions prior to 6.8.14 and 7.10.2.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

The Kibana 'Vega' visualization type is susceptible to both stored and reflected XSS via a vulnerable version of the Vega library.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

`cpe:/a:apache:http_server:2.4.25`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1 ↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

. . . continues on next page . . .

. . . continued from previous page . . .

```
Installed version: 2.4.25
Fixed version:     2.4.26
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow remote attackers to bypass authentication and perform unauthorized actions, cause a denial-of-service condition and gain access to potentially sensitive information.

Solution:
Solution type: VendorFix
Update to Apache HTTP Server 2.2.33 or 2.4.26 or later.

Affected Software/OS
Apache HTTP Server 2.2.x before 2.2.33 and 2.4.x before 2.4.26.

Vulnerability Insight
Multiple flaws exist as,
- The mod_mime can read one byte past the end of a buffer when sending a malicious Content-Type response header.
- The mod_ssl may dereference a NULL pointer when third-party modules call ap_hook_process_connection() during an HTTP request to an HTTPS port.
- An use of the ap_get_basic_auth_pw() by third-party modules outside of the authentication phase may lead to authentication requirements being bypassed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Impact

- CVE-2020-35452: A specially crafted Digest nonce can cause a stack overflow in mod_auth_digest.
- CVE-2021-26690: A specially crafted Cookie header handled by mod_session can cause a NULL pointer dereference and crash, leading to a possible Denial Of Service.
- CVE-2021-26691: A specially crafted SessionHeader sent by an origin server could cause a heap overflow.

Solution:

Solution type: VendorFix

Update to version 2.4.48 or later.

Affected Software/OS

Apache HTTP Server versions 2.4.0 to 2.4.46 on Linux.

Vulnerability Insight

The following vulnerabilities exist:

- CVE-2020-35452: mod_auth_digest possible stack overflow by one null byte
- CVE-2021-26690: mod_session NULL pointer dereference
- CVE-2021-26691: mod_session response handling heap overflow

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `Apache HTTP Server 2.4.0 - 2.4.46 Multiple Vulnerabilities - Linux`

OID:1.3.6.1.4.1.25623.1.0.112897

Version used: `2021-08-24T09:01:06Z`

Product Detection Result

Product: `cpe:/a:apache:http_server:2.4.25`

Method: `Apache HTTP Server Detection Consolidation`

OID: 1.3.6.1.4.1.25623.1.0.117232)

```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.30
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow an attacker to replay HTTP requests across servers without detection, influence the user content, upload a malicious file, crash the Apache HTTP Server and perform denial of service attack.

Solution:

Solution type: VendorFix

Update to version 2.4.30 or later. Please see the references for more information.

Affected Software/OS

Apache HTTP Server versions from 2.4.1 to 2.4.4, 2.4.6, 2.4.7, 2.4.9, 2.4.10, 2.4.12, 2.4.16 to 2.4.18, 2.4.20, 2.4.23, 2.4.25 to 2.4.29.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
Multiple flaws exist due to:
- Apache HTTP Server fails to correctly generate the nonce sent to prevent reply attacks.
- Misconfigured mod_session variable, HTTP_SESSION.
- Apache HTTP Server fails to sanitize the expression specified in '<FilesMatch>'.
- An error in Apache HTTP Server 'mod_authnz_ldap' when configured with AuthLDAPCharsetConfig.
- Apache HTTP Server fails to sanitize against a specially crafted request.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Summary
Apache HTTP Server is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.52
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.52 or later.

Affected Software/OS
Apache HTTP Server versions through 2.4.51.

Vulnerability Insight
A carefully crafted request body can cause a buffer overflow in the mod_lua multipart parser (r:parsebody() called from Lua scripts).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a HTTP request smuggling vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.56
Installation
path / port:       80/tcp
```

Impact

Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

Solution:

Solution type: VendorFix

Update to version 2.4.56 or later.

Affected Software/OS

Apache HTTP Server versions 2.4.0 through 2.4.55.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
Some mod_proxy configurations allow a HTTP Request Smuggling attack.
Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Apache HTTP Server < 2.4.49 Multiple Vulnerabilities - Linux

. . . continues on next page . . .

. . . continued from previous page . . .

Product detection result
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.49
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.49 or later.

Affected Software/OS
Apache HTTP Server version 2.4.48 and prior.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2021-34798: NULL pointer dereference in httpd core
- CVE-2021-39275: ap_escape_quotes buffer overflow
- CVE-2021-40438: mod_proxy SSRF

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: Apache HTTP Server < 2.4.49 Multiple Vulnerabilities - Linux

↪.0.117232)
```

. . . continues on next page . . .

. . . continued from previous page . . .

Summary
Apache HTTP Server is prone to a memory access vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.41
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.41 or later.

Affected Software/OS
Apache HTTP Server version 2.4.18 to 2.4.39.

Vulnerability Insight
Using fuzzed network input, the http/2 session handling could be made to read memory after being freed during connection shutdown.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server Memory Access Vulnerability - Linux`
OID:1.3.6.1.4.1.25623.1.0.114149

NVT: Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.27
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow remote attackers to cause the target service to crash. A remote user can obtain potentially sensitive information as well on the target system.

Solution:

Solution type: VendorFix

Update to Apache HTTP Server 2.2.34 or 2.4.27 or later.

Affected Software/OS

Apache HTTP Server 2.2.x before 2.2.34 and 2.4.x before 2.4.27.

Vulnerability Insight

The flaw exists due to error in Apache 'mod_auth_digest' which does not properly initialize memory used to process 'Digest' type HTTP Authorization headers.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux`

```

. . . continues on next page . . .

. . . continued from previous page . . .

↪_table

Impact
An EOL version of an OS is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: Mitigation
Update the OS on the remote host to a version which is still supported and receiving security updates by the vendor.
Note / Important: Please create an override for this result if the target host is a:
- Windows system with Extended Security Updates (ESU)
- System with additional 3rd-party / non-vendor security updates like e.g. from 'TuxCare', 'Freexian Extended LTS' or similar

Vulnerability Detection Method
Checks if an EOL version of an OS is present on the target host.
Details: `Operating System (OS) End of Life (EOL) Detection`

`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
↪`.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.52
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.52 or later.

Affected Software/OS
Apache HTTP Server version 2.4.7 through 2.4.51.

Vulnerability Insight
A crafted URI sent to httpd configured as a forward proxy (ProxyRequests on) can cause a crash (NULL pointer dereference) or, for configurations mixing forward and reverse proxy declarations, can allow for requests to be directed to a declared Unix Domain Socket endpoint (Server Side Request Forgery).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 2.4.7 - 2.4.51 Multiple Vulnerabilities - Linux`
OID:1.3.6.1.4.1.25623.1.0.117854

NVT: Apache Tomcat AJP RCE Vulnerability (Ghostcat) - Active Check

Summary
Apache Tomcat is prone to a remote code execution (RCE) vulnerability in the AJP connector dubbed 'Ghostcat'.

Quality of Detection (QoD): 99%

Vulnerability Detection Result
```
The returned status is '500', which should be '403' on a patched system, when tr
↪ying to read a file which indicates that the installation is vulnerable.
```

Solution:
Solution type: VendorFix
- Update Apache Tomcat to version 7.0.100, 8.5.51, 9.0.31 or later
- For other products using Tomcat please contact the vendor for more information on fixed versions

Affected Software/OS
Apache Tomcat versions prior 7.0.100, 8.5.51 or 9.0.31 when the AJP connector is enabled.

. . . continues on next page . . .

. . . continued from previous page . . .

Other products like JBoss or Wildfly which are using Tomcat might be affected as well.

Vulnerability Insight
Apache Tomcat server has a file containing vulnerability, which can be used by an attacker to read or include any files in all webapp directories on Tomcat, such as webapp configuration files or source code.

Vulnerability Detection Method
Sends a crafted AJP request and checks the response.
Details: `Apache Tomcat AJP RCE Vulnerability (Ghostcat) - Active Check`

path / port:       8081/tcp
```

Impact

Successful exploitation will allow remote attackers to bypass certain security restrictions and perform unauthorized actions. This may aid in further attacks.

Solution:

Solution type: VendorFix

Upgrade to Apache Tomcat version 9.0.9, 8.0.53, 7.0.89 or 8.5.32 or later. Please see the references for more information.

Affected Software/OS

Apache Tomcat versions 9.0.0.M1 to 9.0.8 Apache Tomcat versions 8.5.0 to 8.5.31 Apache Tomcat versions 8.0.0.RC1 to 8.0.52 Apache Tomcat versions 7.0.41 to 7.0.88

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

The flaw exists because defaults settings for the CORS filter provided in Apache Tomcat are insecure and enable 'supportsCredentials' for all origins.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache Tomcat 'CORS Filter' Setting Security Bypass Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.813378

Summary
Apache Tomcat is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 8.5.23
Fixed version:     8.5.51
Installation
path / port:       8081/tcp
```

Solution:
Solution type: VendorFix
Update to version 7.0.100, 8.5.51, 9.0.31 or later.

Affected Software/OS
Apache Tomcat 7.0.0 to 7.0.99, 8.5.0 to 8.5.50 and 9.0.0.M1 to 9.0.30.

Vulnerability Insight
Apache Tomcat is prone to multiple vulnerabilities:
- HTTP request smuggling vulnerability (CVE-2020-1935)
- AJP Request Injection and potential Remote Code Execution dubbed 'Ghostcat' (CVE-2020-1938)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Apache Tomcat RCE Vulnerability (Mar 2025) - Linux

Product detection result

```
cpe:/a:apache:tomcat:8.5.23
Detected by Apache Tomcat Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.10
↪7652)
```

Summary

Apache Tomcat is prone to a remote code execution (RCE) vulnerability.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     9.0.99
Installation
path / port:       8081/tcp
```

Solution:
Solution type: VendorFix
Update to version 9.0.99, 10.1.35, 11.0.3 or later.

Affected Software/OS
Apache Tomcat version 9.0.98 and prior, 10.x through 10.1.34 and 11.0.0-M1 through 11.0.2.
Note: While not explicitly mentioned by the vendor (due to the EOL status of these branches) it is assumed that the whole 10.x branch and all versions prior to 9.x are affected by these flaws. If you disagree with this assessment and want to accept the risk please create an override for this result.

Vulnerability Insight
The original implementation of partial PUT used a temporary file based on the user provided file name and path with the path separator replaced by '.'.
If all of the following are true, a malicious user is able to view security sensitive files and/or inject content into those files:
- writes enabled for the default servlet (disabled by default)
- support for partial PUT (enabled by default)
- a target URL for security sensitive uploads that is a sub-directory of a target URL for public uploads
- attacker knowledge of the names of security sensitive files being uploaded
- the security sensitive files also being uploaded via partial PUT
If all of the following are true, a malicious user is able to perform remote code execution:
- writes enabled for the default servlet (disabled by default)
- support for partial PUT (enabled by default)
- application is using Tomcat's file based session persistence with the default storage location
- application includes a library that may be leveraged in a deserialization attack

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache Tomcat RCE Vulnerability (Mar 2025) - Linux`

NVT: Apache Tomcat Rewrite Rule Bypass Vulnerability (Apr 2025) - Linux

Product detection result

```
cpe:/a:apache:tomcat:8.5.23
Detected by Apache Tomcat Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.10
↪7652)
```

Summary

Apache Tomcat is prone to a rewrite rule bypass vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

. . . continues on next page . . .

. . . continued from previous page . . .

```
Installed version: 8.5.23
Fixed version:     9.0.104
Installation
path / port:       8081/tcp
```

Solution:
Solution type: VendorFix
Update to version 9.0.104, 10.1.40, 11.0.6 or later.

Affected Software/OS
Apache Tomcat version 9.0.102 and prior, 10.x through 10.1.39 and 11.0.0-M1 through 11.0.5. Note: While not explicitly mentioned by the vendor (due to the EOL status of these branches) it is assumed that the whole 10.x branch and all versions prior to 9.x are affected by these flaws. If you disagree with this assessment and want to accept the risk please create an override for this result.

Vulnerability Insight
For a subset of unlikely rewrite rule configurations, it is possible for a specially crafted request to bypass some rewrite rules. If those rewrite rules effectively enforced security constraints, those constraints could be bypassed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache Tomcat Rewrite Rule Bypass Vulnerability (Apr 2025) - Linux`

2.23.3 Critical 8040/tcp

Critical (CVSS: 10.0)
NVT: Apache Tomcat End of Life (EOL) Detection - Linux

Product detection result

```
cpe:/a:apache:tomcat:8.5.23
Detected by Apache Tomcat Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.10
↪7652)
```

Summary

The Apache Tomcat version on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "Apache Tomcat" version on the remote host has reached the end of life.
CPE:                cpe:/a:apache:tomcat:8.5.23
Installed version:  8.5.23
Location/URL:       8040/tcp
EOL version:        8.5
EOL date:           2024-03-31
```

Impact

An EOL version of Apache Tomcat is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:

Solution type: VendorFix

Update the Apache Tomcat version on the remote host to a still supported version.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Method
Checks if an EOL version is present on the target host.

Summary
Apache Tomcat is prone to a remote code execution (RCE) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 8.5.23
Fixed version:     9.0.99
Installation
path / port:       8040/tcp
```

Solution:
Solution type: VendorFix
Update to version 9.0.99, 10.1.35, 11.0.3 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
Apache Tomcat version 9.0.98 and prior, 10.x through 10.1.34 and 11.0.0-M1 through 11.0.2.
Note: While not explicitly mentioned by the vendor (due to the EOL status of these branches) it is assumed that the whole 10.x branch and all versions prior to 9.x are affected by these flaws. If you disagree with this assessment and want to accept the risk please create an override for this result.

Vulnerability Insight
The original implementation of partial PUT used a temporary file based on the user provided file name and path with the path separator replaced by '.'.
If all of the following are true, a malicious user is able to view security sensitive files and/or inject content into those files:
- writes enabled for the default servlet (disabled by default)
- support for partial PUT (enabled by default)
- a target URL for security sensitive uploads that is a sub-directory of a target URL for public uploads
- attacker knowledge of the names of security sensitive files being uploaded
- the security sensitive files also being uploaded via partial PUT
If all of the following are true, a malicious user is able to perform remote code execution:
- writes enabled for the default servlet (disabled by default)
- support for partial PUT (enabled by default)
- application is using Tomcat's file based session persistence with the default storage location
- application includes a library that may be leveraged in a deserialization attack

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Product detection result

```
cpe:/a:apache:tomcat:8.5.23
Detected by Apache Tomcat Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.10
↪7652)
```

Summary

Apache Tomcat is prone to a security bypass vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     8.5.32
Installation
path / port:       8040/tcp
```

Impact

Successful exploitation will allow remote attackers to bypass certain security restrictions and perform unauthorized actions. This may aid in further attacks.

Solution:

Solution type: VendorFix

. . . continues on next page . . .

. . . continued from previous page . . .

Upgrade to Apache Tomcat version 9.0.9, 8.0.53, 7.0.89 or 8.5.32 or later. Please see the references for more information.

Affected Software/OS
Apache Tomcat versions 9.0.0.M1 to 9.0.8 Apache Tomcat versions 8.5.0 to 8.5.31 Apache Tomcat versions 8.0.0.RC1 to 8.0.52 Apache Tomcat versions 7.0.41 to 7.0.88

Vulnerability Insight
The flaw exists because defaults settings for the CORS filter provided in Apache Tomcat are insecure and enable 'supportsCredentials' for all origins.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Apache Tomcat Multiple Vulnerabilities (Feb 2020) - Linux

Product detection result
`cpe:/a:apache:tomcat:8.5.23`
`Detected by Apache Tomcat Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.10`
`↪7652)`

Summary
Apache Tomcat is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     8.5.51
Installation
path / port:       8040/tcp
```

Solution:
Solution type: VendorFix
Update to version 7.0.100, 8.5.51, 9.0.31 or later.

Affected Software/OS
Apache Tomcat 7.0.0 to 7.0.99, 8.5.0 to 8.5.50 and 9.0.0.M1 to 9.0.30.

Vulnerability Insight
Apache Tomcat is prone to multiple vulnerabilities:
- HTTP request smuggling vulnerability (CVE-2020-1935)
- AJP Request Injection and potential Remote Code Execution dubbed 'Ghostcat' (CVE-2020-1938)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache Tomcat Multiple Vulnerabilities (Feb 2020) - Linux`
OID:1.3.6.1.4.1.25623.1.0.143549
Version used: `2024-02-08T05:05:59Z`

Product Detection Result
Product: `cpe:/a:apache:tomcat:8.5.23`
Method: `Apache Tomcat Detection Consolidation`
OID: 1.3.6.1.4.1.25623.1.0.107652)

NVT: Apache Tomcat Rewrite Rule Bypass Vulnerability (Apr 2025) - Linux

Product detection result

```
cpe:/a:apache:tomcat:8.5.23
Detected by Apache Tomcat Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.10
```

. . . continues on next page . . .

. . . continued from previous page . . .

↪7652)

Summary
Apache Tomcat is prone to a rewrite rule bypass vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     9.0.104
Installation
path / port:       8040/tcp
```

Solution:
Solution type: VendorFix
Update to version 9.0.104, 10.1.40, 11.0.6 or later.

Affected Software/OS
Apache Tomcat version 9.0.102 and prior, 10.x through 10.1.39 and 11.0.0-M1 through 11.0.5. Note: While not explicitly mentioned by the vendor (due to the EOL status of these branches) it is assumed that the whole 10.x branch and all versions prior to 9.x are affected by these flaws. If you disagree with this assessment and want to accept the risk please create an override for this result.

Vulnerability Insight
For a subset of unlikely rewrite rule configurations, it is possible for a specially crafted request to bypass some rewrite rules. If those rewrite rules effectively enforced security constraints, those constraints could be bypassed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

2.23.4 High 8081/tcp

High (CVSS: 8.6)
NVT: Apache Tomcat Request Mix-up Vulnerability (May 2022) - Linux

Product detection result

```
cpe:/a:apache:tomcat:8.5.23
Detected by Apache Tomcat Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.10
↪7652)
```

Summary

Apache Tomcat is prone to a request mix-up vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     8.5.76
Installation
path / port:       8081/tcp
```

Solution:

Solution type: VendorFix

Update to version 8.5.76, 9.0.21 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
Apache Tomcat 8.5.0 through 8.5.75 and 9.0.0.M1 through 9.0.20.

Vulnerability Insight
If a web application sends a WebSocket message concurrently with the WebSocket connection closing, it is possible that the application will continue to use the socket after it has been closed. The error handling triggered in this case could cause the a pooled object to be placed in the pool twice. This could result in subsequent connections using the same object concurrently which could result in data being returned to the wrong use and/or other errors.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

The Apache HTTP Server version on the remote host has reached the End of Life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "Apache HTTP Server" version on the remote host has reached the end of life.
CPE:               cpe:/a:apache:http_server:2.2.34
Installed version: 2.2.34
Location/URL:      80/tcp
EOL version:       2.2
EOL date:          2017-12-31
```

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

An EOL version of the Apache HTTP Server is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: VendorFix
Update the Apache HTTP Server version on the remote host to a still supported version.

Vulnerability Detection Method
Checks if an EOL version is present on the target host.
Details: `Apache HTTP Server End of Life (EOL) Detection - Linux`
OID:1.3.6.1.4.1.25623.1.0.108085

Critical (CVSS: 9.8)
NVT: OpenSSL 1.0.2 and 1.0.1 Multiple Vulnerabilities (Sep 2016) - Linux

Product detection result

```
cpe:/a:openssl:openssl:1.0.1t
Detected by OpenSSL Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.145462)
```

Summary

OpenSSL is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 1.0.1t
Fixed version:     1.0.1u
Installation
path / port:       80/tcp
```

Impact

Successful exploitation could result in Denial of Service.

Solution:

Solution type: VendorFix

OpenSSL 1.0.2 users should upgrade to 1.0.2i, OpenSSL 1.0.1 users should upgrade to 1.0.1u.

Affected Software/OS

OpenSSL 1.0.2 and 1.0.1.

Vulnerability Insight

OpenSSL suffers from the possibility of multiple vulnerabilities due to:

. . . continues on next page . . .

. . . continued from previous page . . .

1) Missing message length checks which results in Out of Bounds reads up to 2 bytes beyond the allocated buffer, this leads to Denial of Service. The attack works only if client authentication is enabled.
2) Calling MDC2_Update() can cause an overflow if an attacker is able to supply very large amounts of input data after a previous call to EVP_EncryptUpdate() with a partial block then a length check can overflow resulting in a heap corruption.
3) A malfored SHA512 TLS session ticket resulting in an Out of Bounds read which leads to service crash.
4) Unchecking the return value of BN_div_word() function causing an Out of Bounds write if it is used with an overly large BIGNUM. TLS is not affected.
5) Misusing OBJ_obj2txt() function by the function TS_OBJ_print_bio() will results in Out of Bounds reads when large OIDs are presented.
6) DTLS out-of-order messages handling which enable an attacker to cause a DoS attack through memory exhaustion.
7) A flaw in the DTLS replay attack protection mechanism enabling the attacker to send records for next epochs with a very large sequence number, this causes in dropping all the subsequent legitimate packets and causing a denial of service for a specific DTLS connection.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.2.34
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.2.34
Fixed version:     2.4.52
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 2.4.52 or later.

Affected Software/OS

Apache HTTP Server versions through 2.4.51.

Vulnerability Insight

A carefully crafted request body can cause a buffer overflow in the mod_lua multipart parser (r:parsebody() called from Lua scripts).

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

```

Solution:
Solution type: VendorFix
Update to version 2.4.60 or later.

Affected Software/OS
Apache HTTP Server version 2.4.59 and prior.

Vulnerability Insight
The following flaws exist:
- CVE-2024-36387: Denial of Service (DoS) by Null pointer in websocket over HTTP/2
- CVE-2024-38473: Proxy encoding problem
- CVE-2024-38474: Weakness with encoded question marks in backreferences
- CVE-2024-38475: Weakness in mod_rewrite when first segment of substitution matches filesystem path
- CVE-2024-38476: May use exploitable/malicious backend application output to run local handlers via internal redirect
- CVE-2024-38477: Crash resulting in DoS in mod_proxy via a malicious request
- CVE-2024-39573: mod_rewrite proxy handler substitution

Detected by Mort Bay / Eclipse Jetty Detection (HTTP) (OID: 1.3.6.1.4.1.25623.1.
↪0.800953)
```

Summary

The Mort Bay / Eclipse Jetty version on the remote host has reached the End of Life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "Mort Bay / Eclipse Jetty" version on the remote host has reached the end of
↪ life.
CPE:               cpe:/a:eclipse:jetty:8.1.16.20140903
Installed version: 8.1.16.20140903
Location/URL:      8081/tcp
EOL version:       8.1
EOL date:          2014-12-31
```

Impact

An EOL version of Mort Bay / Eclipse Jetty is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:

Solution type: VendorFix

Update the Mort Bay / Eclipse Jetty version on the remote host to a still supported version.

Vulnerability Detection Method

Checks if an EOL version is present on the target host.

```

Impact
An EOL version of Mort Bay / Eclipse Jetty is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: VendorFix
Update the Mort Bay / Eclipse Jetty version on the remote host to a still supported version.

Vulnerability Detection Method
Checks if an EOL version is present on the target host.
Details: `Mort Bay / Eclipse Jetty End of Life (EOL) Detection - Linux`
OID:1.3.6.1.4.1.25623.1.0.117294
Version used: `2025-04-15T05:54:49Z`

Product Detection Result
Product: `cpe:/a:eclipse:jetty:9.2`
Method: `Mort Bay / Eclipse Jetty Detection (HTTP)`
OID: 1.3.6.1.4.1.25623.1.0.800953)

Critical (CVSS: 9.8)
NVT: Jenkins < 2.154 and < 2.138.4 LTS Multiple Vulnerabilities - Linux

Summary
Jenkins is prone to multiple vulnerabilities.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.60
Fixed version:     2.154
Installation
path / port:       /
```

Solution:
Solution type: VendorFix
Upgrade to Jenkins weekly to 2.154 or later / Jenkins LTS to either 2.138.4 or 2.150.1 or later.

Affected Software/OS
Jenkins LTS up to and including 2.138.3, Jenkins weekly up to and including 2.153.

Vulnerability Insight
Jenkins is prone to the following vulnerabilities:
- Code execution through crafted URLs (CVE-2018-1000861).
- Forced migration of user records (CVE-2018-1000863).
- Workspace browser allowed accessing files outside the workspace (CVE-2018-1000862).
- Potential denial of service through cron expression form validation (CVE-2018-1000864).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Jenkins < 2.154 and < 2.138.4 LTS Multiple Vulnerabilities - Linux`
OID:1.3.6.1.4.1.25623.1.0.108511

Critical (CVSS: 9.4)
NVT: Jenkins < 2.243, < 2.235.5 LTS Buffer Corruption in bundled Jetty - Linux

Summary
Jenkins is prone to a buffer corruption in bundled Jetty.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.60
Fixed version:     2.243
Installation
path / port:       /
```

Impact

This vulnerability may allow unauthenticated attackers to obtain HTTP response headers that may include sensitive data intended for another user.

Solution:

Solution type: VendorFix

Update to version 2.243, 2.235.5 LTS or later.

Affected Software/OS

Jenkins version 2.242 and prior and 2.235.4 LTS and prior.

Vulnerability Insight

In Eclipse Jetty in case of too large response headers, Jetty throws an exception to produce an HTTP 431 error. When this happens, the ByteBuffer containing the HTTP response headers is released back to the ByteBufferPool twice. Because of this double release, two threads can acquire the same ByteBuffer from the pool and while thread1 is about to use the ByteBuffer to write response1 data, thread2 fills the ByteBuffer with response2 data. Thread1 then proceeds to write the buffer that now contains response2 data.

This results in client1, which issued request1 and expects responses, to see response2 which could contain sensitive data belonging to client2 (HTTP session ids, authentication credentials, etc.).

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `Jenkins < 2.243, < 2.235.5 LTS Buffer Corruption in bundled Jetty - Linux`

OID:1.3.6.1.4.1.25623.1.0.112811

2.26.2 High 8080/tcp

High (CVSS: 8.8)
NVT: Jenkins < 2.133 and < 2.121.2 LTS Multiple Vulnerabilities - Linux

Summary
Jenkins is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.60
Fixed version:     2.133
Installation
path / port:       /
```

Solution:
Solution type: VendorFix
Upgrade to Jenkins weekly to 2.132 or later / Jenkins LTS to 2.121.2 or later.

Affected Software/OS
Jenkins LTS up to and including 2.121.1, Jenkins weekly up to and including 2.132.

Vulnerability Insight
Jenkins is prone to the following vulnerabilities:
- Users without Overall/Read permission can have Jenkins reset parts of global configuration on the next restart (CVE-2018-1999001).
- Arbitrary file read vulnerability (CVE-2018-1999002).
- Unauthorized users could cancel queued builds (CVE-2018-1999003).
- Unauthorized users could initiate and abort agent launches (CVE-2018-1999004).
- Stored XSS vulnerability (CVE-2018-1999005).
- Unauthorized users are able to determine when a plugin was extracted from its JPI package (CVE-2018-1999006).
- XSS vulnerability in Stapler debug mode (CVE-2018-1999007).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Jenkins < 2.133 and < 2.121.2 LTS Multiple Vulnerabilities - Linux`

High (CVSS: 8.8)
NVT: Jenkins Multiple Vulnerabilities (Oct 2017) - Linux

Summary
Jenkins is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.60
Fixed version:     2.84
Installation
path / port:       /
```

Impact
Successful exploitation will allow remote attackers to obtain sensitive information, and execute arbitrary code.

Solution:
Solution type: VendorFix
Upgrade to Jenkins weekly to 2.84 or later / Jenkins LTS to 2.73.2 or later.

Affected Software/OS
Jenkins LTS 2.73.1 and prior, Jenkins weekly up to and including 2.83.

Vulnerability Insight
Multiple flaws are due to:
- arbitrary shell command execution
- bundling vulnerable libraries
- disclosing various information
- sending form validation for passwords via GET

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Jenkins Multiple Vulnerabilities (Oct 2017) - Linux`

High (CVSS: 8.6)
NVT: Jenkins < 2.214, < 2.204.2 LTS Authentication Bypass Vulnerability - Linux

Summary
Jenkins is prone to an inbound TCP Agent Protocol/3 authentication bypass vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 2.60
Fixed version:     2.214
Installation
path / port:       /
```

Solution:
Solution type: VendorFix
Update to version 2.214, 2.204.2 LTS or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
Jenkins version 2.213 and prior and 2.204.1 LTS and prior.

Vulnerability Insight
Jenkins includes support for the Inbound TCP Agent Protocol/3 for communication between master and agents. While this protocol has been deprecated in 2018 and was recently removed from Jenkins in 2.214, it could still easily be enabled in Jenkins LTS 2.204.1, 2.213, and older. This protocol incorrectly reuses encryption parameters which allow an unauthenticated remote attacker to determine the connection secret. This secret can then be used to connect attacker-controlled Jenkins agents to the Jenkins master.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Jenkins < 2.214, < 2.204.2 LTS Authentication Bypass Vulnerability - Linux`

Critical (CVSS: 9.8)
NVT: Apache HTTP Server <= 2.4.52 Multiple Vulnerabilities - Linux

Product detection result
`cpe:/a:apache:http_server:2.2.34`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.2.34
Fixed version:     2.4.53
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.53 or later.

Affected Software/OS
Apache HTTP Server version 2.4.52 and prior.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2022-22719: mod_lua Use of uninitialized value of in r:parsebody
- CVE-2022-22720: HTTP request smuggling vulnerability
- CVE-2022-22721: Possible buffer overflow with very large or unlimited LimitXMLRequestBody
- CVE-2022-23943: mod_sed: Read/write beyond bounds

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server <= 2.4.52 Multiple Vulnerabilities - Linux`
OID:1.3.6.1.4.1.25623.1.0.113837
Version used: `2022-03-21T03:03:41Z`

Product detection result

```
cpe:/a:apache:http_server:2.2.34
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.2.34
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
Fixed version:     2.4.52
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.52 or later.

Affected Software/OS
Apache HTTP Server versions through 2.4.51.

Vulnerability Insight
A carefully crafted request body can cause a buffer overflow in the mod_lua multipart parser (r:parsebody() called from Lua scripts).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.2.34
Fixed version:     2.4.54
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 2.4.54 or later.

Affected Software/OS

Apache HTTP Server version 2.4.53 and prior.

Vulnerability Insight

The following vulnerabilities exist:

- CVE-2022-26377: mod_proxy_ajp: Possible request smuggling
- CVE-2022-28614: Read beyond bounds via ap_rwrite()
- CVE-2022-28615: Read beyond bounds in ap_strcmp_match()
- CVE-2022-29404: Denial of service in mod_lua r:parsebody
- CVE-2022-30556: Information disclosure in mod_lua with websockets
- CVE-2022-31813: mod_proxy X-Forwarded-For dropped by hop-by-hop mechanism

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Detected by OpenSSL Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.145462)

. . . continues on next page . . .

. . . continued from previous page . . .

Summary
OpenSSL is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 1.0.1t
Fixed version:     1.0.1u
Installation
path / port:       80/tcp
```

Impact
Successful exploitation could result in Denial of Service.

Solution:
Solution type: VendorFix
OpenSSL 1.0.2 users should upgrade to 1.0.2i, OpenSSL 1.0.1 users should upgrade to 1.0.1u.

Affected Software/OS
OpenSSL 1.0.2 and 1.0.1.

Vulnerability Insight
OpenSSL suffers from the possibility of multiple vulnerabilities due to:
1) Missing message length checks which results in Out of Bounds reads up to 2 bytes beyond the allocated buffer, this leads to Denial of Service. The attack works only if client authentication is enabled.
2) Calling MDC2_Update() can cause an overflow if an attacker is able to supply very large amounts of input data after a previous call to EVP_EncryptUpdate() with a partial block then a length check can overflow resulting in a heap corruption.
3) A malfored SHA512 TLS session ticket resulting in an Out of Bounds read which leads to service crash.
4) Unchecking the return value of BN_div_word() function causing an Out of Bounds write if it is used with an overly large BIGNUM. TLS is not affected.
5) Misusing OBJ_obj2txt() function by the function TS_OBJ_print_bio() will results in Out of Bounds reads when large OIDs are presented.
6) DTLS out-of-order messages handling which enable an attacker to cause a DoS attack through memory exhaustion.
7) A flaw in the DTLS replay attack protection mechanism enabling the attacker to send records for next epochs with a very large sequence number, this causes in dropping all the subsequent legitimate packets and causing a denial of service for a specific DTLS connection.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `OpenSSL 1.0.2 and 1.0.1 Multiple Vulnerabilities (Sep 2016) - Linux`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.2.34
Fixed version:     2.4.55
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.55 or later.

Affected Software/OS
Apache HTTP Server version 2.4.54 and prior.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2006-20001: mod_dav out of bounds read, or write of zero byte
- CVE-2022-36760: Possible request smuggling in mod_proxy_ajp
- CVE-2022-37436: mod_proxy allows a backend to trigger HTTP response splitting

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Nginx End of Life (EOL) Detection

Product detection result

```
cpe:/a:f5:nginx:1.12.2
Detected by nginx Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.113787)
```

Summary

The Nginx version on the remote host has reached the End of Life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "Nginx" version on the remote host has reached the end of life.
CPE:               cpe:/a:nginx:nginx:1.12.2
Installed version: 1.12.2
Location/URL:      80/tcp
EOL version:       1.12
EOL date:          2018-04-17
```

. . . continues on next page . . .

. . . continued from previous page . . .

Impact
An EOL version of Nginx is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: VendorFix
Update the Nginx version on the remote host to a still supported version.

Vulnerability Detection Method
Checks if an EOL version is present on the target host.
Details: `Nginx End of Life (EOL) Detection`
OID:1.3.6.1.4.1.25623.1.0.148940
Version used: `2025-04-15T05:54:49Z`

Critical (CVSS: 9.8)
NVT: nginx < 1.13.6 Buffer Overflow Vulnerability

Product detection result
`cpe:/a:f5:nginx:1.12.2`
`Detected by nginx Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.113787)`

Summary
nginx is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 1.12.2
Fixed version:     1.13.6
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 1.13.6 or later.

Affected Software/OS

. . . continues on next page . . .

. . . continued from previous page . . .

nginx before version 1.13.6.

Vulnerability Insight
The buffer overflow exists for years that exceed four digits, as demonstrated by a file with a modification date in 1969 that causes an integer overflow (or a false modification date far in the future), when encountered by the autoindex module.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: PHP End of Life (EOL) Detection - Linux

Product detection result
`cpe:/a:php:php:7.0.25`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
The PHP version on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "PHP" version on the remote host has reached the end of life.
CPE:                cpe:/a:php:php:7.0.25
Installed version: 7.0.25
EOL version:        7.0
EOL date:           2019-01-10
```

Impact
An EOL version of PHP is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: VendorFix
Update the PHP version on the remote host to a still supported version.

Vulnerability Insight
Each release branch of PHP is fully supported for two years from its initial stable release. During this period, bugs and security issues that have been reported are fixed and are released in regular point releases.
After this two year period of active support, each branch is then supported for an additional year for critical security issues only. Releases during this period are made on an as-needed basis: there may be multiple point releases, or none, depending on the number of reports.
Once the three years of support are completed, the branch reaches its end of life and is no longer supported.

Vulnerability Detection Method
Checks if an EOL version is present on the target host.
Details: `PHP End of Life (EOL) Detection - Linux`

Critical (CVSS: 9.8)
NVT: Apache HTTP Server Multiple Vulnerabilities (Jun 2017) - Linux

Product detection result
`cpe:/a:apache:http_server:2.4.10`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.10
Fixed version:     2.4.26
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow remote attackers to bypass authentication and perform unauthorized actions, cause a denial-of-service condition and gain access to potentially sensitive information.

Solution:
Solution type: VendorFix
Update to Apache HTTP Server 2.2.33 or 2.4.26 or later.

Affected Software/OS
Apache HTTP Server 2.2.x before 2.2.33 and 2.4.x before 2.4.26.

Vulnerability Insight
Multiple flaws exist as,
- The mod_mime can read one byte past the end of a buffer when sending a malicious Content-Type response header.
- The mod_ssl may dereference a NULL pointer when third-party modules call ap_hook_process_connection() during an HTTP request to an HTTPS port.
- An use of the ap_get_basic_auth_pw() by third-party modules outside of the authentication phase may lead to authentication requirements being bypassed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Product detection result
`cpe:/a:apache:http_server:2.4.10`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.10
Fixed version:     2.4.48
Installation
path / port:       80/tcp
```

Impact
- CVE-2020-35452: A specially crafted Digest nonce can cause a stack overflow in mod_auth_digest.
- CVE-2021-26690: A specially crafted Cookie header handled by mod_session can cause a NULL pointer dereference and crash, leading to a possible Denial Of Service.
- CVE-2021-26691: A specially crafted SessionHeader sent by an origin server could cause a heap overflow.

Solution:
Solution type: VendorFix
Update to version 2.4.48 or later.

Affected Software/OS
Apache HTTP Server versions 2.4.0 to 2.4.46 on Linux.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2020-35452: mod_auth_digest possible stack overflow by one null byte
- CVE-2021-26690: mod_session NULL pointer dereference
- CVE-2021-26691: mod_session response handling heap overflow

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: PHP < 7.1.33, 7.2.x < 7.2.24, 7.3.x < 7.3.11 RCE Vulnerability - Version Check

Product detection result
cpe:/a:php:php:7.0.25
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

PHP is prone to a remote code execution (RCE) vulnerability in certain nginx + php-fpm configurations.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.25
Fixed version:     7.1.33
Installation
path / port:       80/tcp
```

Impact

Successful exploitation would allow an unauthenticated remote attacker to execute arbitrary code on the target machine.

Solution:

Solution type: VendorFix

Update to version 7.1.33, 7.2.24, 7.3.11 or later.

As an alternative a workaround to update the nginx configuration to mitigate this vulnerability is described at the PHP.net bugtracker linked in the references.

Affected Software/OS

PHP prior to version 7.1.33, 7.2.x prior to 7.2.24 and 7.3.x prior to 7.3.11.

Vulnerability Insight

The file sapi/fpm/fpm/fpm_main.c contains pointer arithmetic that assumes that env_path_info has a prefix equal to the path to the php script. However, the code does not check this assumption is satisfied. The absence of the check can lead to an invalid pointer in the 'path_info' variable.

Such conditions can be achieved in a pretty standard Nginx configuration. The regexp in 'fastcgi_split_path_info' directive can be broken using the newline character (in encoded form, %0a). Broken regexp leads to empty PATH_INFO, which triggers the bug.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `PHP < 7.1.33, 7.2.x < 7.2.24, 7.3.x < 7.3.11 RCE Vulnerability - Version Check`

Product detection result
`cpe:/a:php:php:7.0.25`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to a stack buffer overflow vulnerability.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.25
Fixed version:     7.0.28
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow an attacker to execute arbitrary code in the context of the affected application. Failed exploit attempts will result in denial-of-service conditions.

Solution:

Solution type: VendorFix

Update to version 5.6.34, 7.0.28, 7.1.15, 7.2.3 or later.

Affected Software/OS

PHP versions 5.x prior to 5.6.34, 7.x prior to 7.0.28, 7.1.x prior to 7.1.15 and 7.2.x prior to 7.2.3 on Linux.

Vulnerability Insight

The flaw exists because php fails to adequately bounds-check user-supplied data before copying it into an insufficiently sized buffer.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `PHP 5.x < 5.6.34, 7.x < 7.0.28, 7.1.x < 7.1.15, 7.2.x < 7.2.3 Stack Buffer Over.`

NVT: Apache HTTP Server < 2.4.60 Multiple Vulnerabilities - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.10
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.10
Fixed version:     2.4.60
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 2.4.60 or later.

Affected Software/OS

Apache HTTP Server version 2.4.59 and prior.

Vulnerability Insight

The following flaws exist:

- CVE-2024-36387: Denial of Service (DoS) by Null pointer in websocket over HTTP/2
- CVE-2024-38473: Proxy encoding problem
- CVE-2024-38474: Weakness with encoded question marks in backreferences
- CVE-2024-38475: Weakness in mod_rewrite when first segment of substitution matches filesystem path
- CVE-2024-38476: May use exploitable/malicious backend application output to run local handlers via internal redirect

. . . continues on next page . . .

. . . continued from previous page . . .

- CVE-2024-38477: Crash resulting in DoS in mod_proxy via a malicious request
- CVE-2024-39573: mod_rewrite proxy handler substitution

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Apache HTTP Server Multiple Vulnerabilities (Apr 2018) - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.10
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.10
Fixed version:     2.4.30
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow an attacker to replay HTTP requests across servers without detection, influence the user content, upload a malicious file, crash the Apache HTTP Server and perform denial of service attack.

Solution:

Solution type: VendorFix

Update to version 2.4.30 or later. Please see the references for more information.

Affected Software/OS

Apache HTTP Server versions from 2.4.1 to 2.4.4, 2.4.6, 2.4.7, 2.4.9, 2.4.10, 2.4.12, 2.4.16 to 2.4.18, 2.4.20, 2.4.23, 2.4.25 to 2.4.29.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
Multiple flaws exist due to:
- Apache HTTP Server fails to correctly generate the nonce sent to prevent reply attacks.
- Misconfigured mod_session variable, HTTP_SESSION.
- Apache HTTP Server fails to sanitize the expression specified in '<FilesMatch>'.
- An error in Apache HTTP Server 'mod_authnz_ldap' when configured with AuthLDAPCharsetConfig.
- Apache HTTP Server fails to sanitize against a specially crafted request.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: PHP 7.0.0 <= 7.1.15 DoS Vulnerability (Aug 2018) - Linux

Product detection result

```
cpe:/a:php:php:7.0.25
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.25
Fixed version:     None
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow attackers to cause a denial of service by performing an integer overflow and therefore crashing the application.

Solution:

Solution type: WillNotFix

No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS

PHP versions 7.x through 7.1.15.

Vulnerability Insight

The flaw exists due to how mysqli_real_escape_string function in mysqli/mysqli_api.c file improperly handles long strings.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `PHP 7.0.0 <= 7.1.15 DoS Vulnerability (Aug 2018) - Linux`

Affected Software/OS
PHP versions through 7.1.5.

Vulnerability Insight
The following flaws exist:

. . . continues on next page . . .

. . . continued from previous page . . .

- CVE-2017-8923: The zend_string_extend function in Zend/zend_string.h does not prevent changes to string objects that result in a negative length, which allows remote attackers to cause a denial of service (application crash) or possibly have unspecified other impact by leveraging a script's use of .= with a long string.
- CVE-2017-9119: The i_zval_ptr_dtor function in Zend/zend_variables.h allows attackers to cause a denial of service (memory consumption and application crash) or possibly have unspecified other impact by triggering crafted operations on array data structures.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

```

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.25
Fixed version:     7.1.27
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 7.1.27, 7.2.16, 7.3.3 or later.

Affected Software/OS
PHP version 7.x before 7.1.27, 7.2.x before 7.2.16 and 7.3.x before 7.3.3.

Vulnerability Insight
PHP is prone to multiple vulnerabilities:
- Due to the way rename() across filesystems is implemented, it is possible that file being renamed is briefly available with wrong permissions while the rename is ongoing, thus enabling unauthorized users to access the data. (CVE-2019-9637)
- Uninitialized read in exif_process_IFD_in_MAKERNOTE because of mishandling the maker_note->offset relationship to value_len (CVE-2019-9638)
- Uninitialized read in exif_process_IFD_in_MAKERNOTE because of mishandling the data_len variable (CVE-2019-9639)
- Invalid Read in exif_process_SOFn (CVE-2019-9640)
- Uninitialized read in exif_process_IFD_in_TIFF (CVE-2019-9641)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Product detection result

```
cpe:/a:php:php:7.0.25
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.25
Fixed version:     8.1.29
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 8.1.29, 8.2.20, 8.3.8 or later.

Affected Software/OS

PHP prior to version 8.1.29, version 8.2.x through 8.2.19 and 8.3.x through 8.3.7.

Vulnerability Insight

The following vulnerabilities exist:
- CVE-2024-4577: Argument injection in PHP-CGI (bypass of CVE-2012-1823)
- CVE-2024-5458: Filter bypass in filter_var FILTER_VALIDATE_URL
- CVE-2024-5585: Bypass of CVE-2024-1874

Note: As of 06/2024 the CVEs CVE-2024-4577 and CVE-2024-5585 are known to be exploitable on Windows systems only.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.
Details: `PHP < 8.1.29, 8.2.x < 8.2.20, 8.3.x < 8.3.8 Multiple Vulnerabilities - Linux`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.25
Fixed version:     8.1.31
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.1.31, 8.2.26, 8.3.14 or later.

Affected Software/OS
PHP versions prior to 8.1.31, 8.2.x prior to 8.2.26 and 8.3.x prior to 8.3.14.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2024-8929: Leak partial content of the heap through heap buffer over-read
- CVE-2024-8932: OOB access in ldap_escape
- CVE-2024-11233: Single byte overread with convert.quoted-printable-decode filter
- CVE-2024-11234: Configuring a proxy in a stream context might allow for CRLF injection in URIs
- CVE-2024-11236: Integer overflow in the firebird/dblib quoter causing OOB writes
- No CVE: Heap-Use-After-Free in sapi_read_post_data Processing in CLI SAPI Interface

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.25
Fixed version:     8.1.32
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 8.1.32, 8.2.28 or later.

Affected Software/OS

. . . continues on next page . . .

. . . continued from previous page . . .

PHP versions prior to 8.1.32, and 8.2.x prior to 8.2.28.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2025-1217: Header parser of 'http' stream wrapper does not handle folded headers
- CVE-2025-1219: libxml streams use wrong 'content-type' header when requesting a redirected resource
- CVE-2025-1734: Streams HTTP wrapper does not fail for headers without colon
- CVE-2025-1736: Stream HTTP wrapper header check might omit basic auth header
- CVE-2025-1861: Stream HTTP wrapper truncate redirect location to 1024 bytes

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.25
Fixed version:     7.1.26
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 5.6.40, 7.1.16, 7.2.14, 7.3.1 or later.

Affected Software/OS
PHP versions before 5.6.40, 7.x before 7.1.26, 7.2.x before 7.2.14 and 7.3.x before 7.3.1.

Vulnerability Insight
The following flaws exist:
- Fixed bug #77269 (efree() on uninitialized Heap data in imagescale leads to use-after-free). (CVE-2016-10166)
- Fixed bug #77270 (imagecolormatch Out Of Bounds Write on Heap). (CVE-2019-6977)
- Fixed bug #77370 (Buffer overflow on mb regex functions - fetch_token). (CVE-2019-9023)
- Fixed bug #77371 (heap buffer overflow in mb regex functions - compile_string_node). (CVE-2019-9023)
- Fixed bug #77381 (heap buffer overflow in multibyte match_at). (CVE-2019-9023)
- Fixed bug #77382 (heap buffer overflow due to incorrect length in expand_case_fold_string). (CVE-2019-9023)
- Fixed bug #77385 (buffer overflow in fetch_token). (CVE-2019-9023)
- Fixed bug #77394 (Buffer overflow in multibyte case folding - unicode). (CVE-2019-9023)
- Fixed bug #77418 (Heap overflow in utf32be_mbc_to_code). (CVE-2019-9023)
- Fixed bug #77247 (heap buffer overflow in phar_detect_phar_fname_ext). (CVE-2019-9021)
- Fixed bug #77242 (heap out of bounds read in xmlrpc_decode()). (CVE-2019-9020)
- Fixed bug #77380 (Global out of bounds read in xmlrpc base64 code). (CVE-2019-9024)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.10
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.10
Fixed version:     2.4.52
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 2.4.52 or later.

Affected Software/OS

Apache HTTP Server versions through 2.4.51.

Vulnerability Insight

A carefully crafted request body can cause a buffer overflow in the mod_lua multipart parser (r:parsebody() called from Lua scripts).

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

NVT: PHP < 7.4.28, 8.0.x < 8.0.16, 8.1.x < 8.1.3 Security Update (Feb 2022) - Linux

Product detection result

```
cpe:/a:php:php:7.0.25
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP released new versions which include a security fix.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.25
Fixed version:     7.4.28
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 7.4.28, 8.0.16, 8.1.3 or later.

Affected Software/OS

PHP prior to version 7.4.28, 8.0.x through 8.0.15 and 8.1.x through 8.1.2.

Vulnerability Insight

Fix #81708: UAF due to php_filter_float() failing for ints.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

NVT: PHP 'CVE-2019-13224' Use-After-Free Vulnerability - Linux

Product detection result

```
cpe:/a:php:php:7.0.25
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a use-after-free vulnerability in a used third-pary library.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.25
Fixed version:     7.1.32
Installation
path / port:       80/tcp
```

Impact

This flaw allows attackers to potentially cause information disclosure, denial of service, or possibly code execution by providing a crafted regular expression.

Solution:

Solution type: VendorFix

Update to version 7.1.32, 7.3.9 or later.

Affected Software/OS

PHP version before 7.1.32 and 7.3.x before 7.3.9.

Vulnerability Insight

The flaw exists due to a use-after-free in onig_new_deluxe() in regext.c of the third-party library Oniguruma 6.9.2 which is used by PHP.

The attacker provides a pair of a regex pattern and a string, with a multi-byte encoding that gets handled by onig_new_deluxe().

NVT: Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux

Product detection result
```
cpe:/a:apache:http_server:2.4.10
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary
Apache HTTP Server is prone to a HTTP request smuggling vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 2.4.10
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
Fixed version:     2.4.56
Installation
path / port:       80/tcp
```

Impact
Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

Solution:
Solution type: VendorFix
Update to version 2.4.56 or later.

Affected Software/OS
Apache HTTP Server versions 2.4.0 through 2.4.55.

Vulnerability Insight
Some mod_proxy configurations allow a HTTP Request Smuggling attack.
Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux`

NVT: Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.10
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.10
Fixed version:     2.4.27
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow remote attackers to cause the target service to crash. A remote user can obtain potentially sensitive information as well on the target system.

Solution:

Solution type: VendorFix

Update to Apache HTTP Server 2.2.34 or 2.4.27 or later.

Affected Software/OS

Apache HTTP Server 2.2.x before 2.2.34 and 2.4.x before 2.4.27.

Vulnerability Insight

The flaw exists due to error in Apache 'mod_auth_digest' which does not properly initialize memory used to process 'Digest' type HTTP Authorization headers.

2.29.2 Critical general/tcp

Critical (CVSS: 10.0)
NVT: Operating System (OS) End of Life (EOL) Detection

Product detection result

```
cpe:/o:debian:debian_linux:8
Detected by OS Detection Consolidation and Reporting (OID: 1.3.6.1.4.1.25623.1.0
↪.105937)
```

Summary

The Operating System (OS) on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The "Debian GNU/Linux" Operating System on the remote host has reached the end o
↪f life.
CPE:                cpe:/o:debian:debian_linux:8
Installed version,
build or SP:        8
EOL date:           2020-06-30
EOL info:           https://en.wikipedia.org/wiki/List_of_Debian_releases#Release
↪_table
```

Impact

An EOL version of an OS is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:

Solution type: Mitigation

Update the OS on the remote host to a version which is still supported and receiving security updates by the vendor.

Note / Important: Please create an override for this result if the target host is a:
- Windows system with Extended Security Updates (ESU)
- System with additional 3rd-party / non-vendor security updates like e.g. from 'TuxCare', 'Freexian Extended LTS' or similar

Vulnerability Detection Method

Checks if an EOL version of an OS is present on the target host.

Details: `Operating System (OS) End of Life (EOL) Detection`

NVT: PHP < 8.1.30, 8.2.x < 8.2.24, 8.3.x < 8.3.12 Multiple Vulnerabilities - Linux

Product detection result
cpe:/a:php:php:7.0.25
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.25
Fixed version:     8.1.30
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.1.30, 8.2.24, 8.3.12 or later.

Affected Software/OS
PHP versions prior to 8.1.30, 8.2.x prior to 8.2.24 and 8.3.x prior to 8.3.12.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2024-8925, CVE-2024-8928: Erroneous parsing of multipart form data
- CVE-2024-8926: Bypass of CVE-2024-4577, Parameter Injection Vulnerability
- CVE-2024-8927: cgi.force_redirect configuration is bypassable due to the environment variable collision
- CVE-2024-9026: Logs from children may be altered

Vulnerability Detection Method

. . . continues on next page . . .

. . . continued from previous page . . .

Checks if a vulnerable version is present on the target host.

Product detection result
cpe:/a:php:php:7.0.25

. . . continues on next page . . .

. . . continued from previous page . . .

Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.25
Fixed version:     7.0.30
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow an attacker to conduct XSS attacks, crash PHP, conduct denial of service condition and execute arbitrary code in the context of the affected application.

Solution:
Solution type: VendorFix
Update to version 5.6.36, 7.0.30, 7.1.17, 7.2.5 or later.

Affected Software/OS
PHP prior to version 5.6.36, 7.0.x prior to 7.0.30, 7.1.x prior to 7.1.17 and 7.2.x prior to 7.2.5 on Linux.

Vulnerability Insight
The following flaws exist:
- CVE-2018-10549: Out of bounds read error in 'exif_read_data' function while processing crafted JPG data.
- CVE-2018-10546: An error in stream filter 'convert.iconv' which leads to infinite loop on invalid sequence.
- CVE-2018-10548: An error in the LDAP module of PHP which allows a malicious LDAP server or man-in-the-middle attacker to crash PHP.
- CVE-2018-10547: An error in the 'phar_do_404()' function in 'ext/phar/phar_object.c' script which returns parts of the request unfiltered, leading to another XSS vector. This is due to incomplete fix for CVE-2018-5712.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: PHP < 5.6.36, 7.x < 7.0.30, 7.1.x < 7.1.17, 7.2.x < 7.2.5 Multiple Vulnerabilit.

NVT: Apache HTTP Server 2.4.7 - 2.4.51 Multiple Vulnerabilities - Linux

Product detection result
`cpe:/a:apache:http_server:2.4.10`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.10
Fixed version:     2.4.52
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.52 or later.

Affected Software/OS
Apache HTTP Server version 2.4.7 through 2.4.51.

Vulnerability Insight
A crafted URI sent to httpd configured as a forward proxy (ProxyRequests on) can cause a crash (NULL pointer dereference) or, for configurations mixing forward and reverse proxy declarations, can allow for requests to be directed to a declared Unix Domain Socket endpoint (Server Side Request Forgery).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Operating System (OS) End of Life (EOL) Detection

Product detection result

```
cpe:/o:debian:debian_linux:9
Detected by OS Detection Consolidation and Reporting (OID: 1.3.6.1.4.1.25623.1.0
↪.105937)
```

Summary

The Operating System (OS) on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The "Debian GNU/Linux" Operating System on the remote host has reached the end o
↪f life.
CPE:                cpe:/o:debian:debian_linux:9
Installed version,
build or SP:        9
EOL date:           2022-06-30
EOL info:           https://en.wikipedia.org/wiki/List_of_Debian_releases#Release
↪_table
```

Impact

An EOL version of an OS is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:

Solution type: Mitigation

Update the OS on the remote host to a version which is still supported and receiving security updates by the vendor.

Note / Important: Please create an override for this result if the target host is a:
- Windows system with Extended Security Updates (ESU)
- System with additional 3rd-party / non-vendor security updates like e.g. from 'TuxCare', 'Freexian Extended LTS' or similar

Vulnerability Detection Method

Checks if an EOL version of an OS is present on the target host.

Details: `Operating System (OS) End of Life (EOL) Detection`

OID:1.3.6.1.4.1.25623.1.0.103674

2.30.2 Critical 80/tcp

Critical (CVSS: 9.8)
NVT: Apache HTTP Server Multiple Vulnerabilities (Jun 2017) - Linux

Product detection result
`cpe:/a:apache:http_server:2.4.25`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.26
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow remote attackers to bypass authentication and perform unauthorized actions, cause a denial-of-service condition and gain access to potentially sensitive information.

Solution:
Solution type: VendorFix
Update to Apache HTTP Server 2.2.33 or 2.4.26 or later.

Affected Software/OS
Apache HTTP Server 2.2.x before 2.2.33 and 2.4.x before 2.4.26.

Vulnerability Insight
Multiple flaws exist as,
- The mod_mime can read one byte past the end of a buffer when sending a malicious Content-Type response header.
- The mod_ssl may dereference a NULL pointer when third-party modules call ap_hook_process_connection() during an HTTP request to an HTTPS port.

. . . continues on next page . . .

. . . continued from previous page . . .

- An use of the ap_get_basic_auth_pw() by third-party modules outside of the authentication phase may lead to authentication requirements being bypassed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server Multiple Vulnerabilities (Jun 2017) - Linux`

Product detection result

```
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.30
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow an attacker to replay HTTP requests across servers without detection, influence the user content, upload a malicious file, crash the Apache HTTP Server and perform denial of service attack.

Solution:

Solution type: VendorFix

Update to version 2.4.30 or later. Please see the references for more information.

Affected Software/OS

Apache HTTP Server versions from 2.4.1 to 2.4.4, 2.4.6, 2.4.7, 2.4.9, 2.4.10, 2.4.12, 2.4.16 to 2.4.18, 2.4.20, 2.4.23, 2.4.25 to 2.4.29.

Vulnerability Insight

Multiple flaws exist due to:
- Apache HTTP Server fails to correctly generate the nonce sent to prevent reply attacks.
- Misconfigured mod_session variable, HTTP_SESSION.

. . . continues on next page . . .

. . . continued from previous page . . .

- Apache HTTP Server fails to sanitize the expression specified in '<FilesMatch>'.
- An error in Apache HTTP Server 'mod_authnz_ldap' when configured with AuthLDAPCharsetConfig.
- Apache HTTP Server fails to sanitize against a specially crafted request.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server Multiple Vulnerabilities (Apr 2018) - Linux`
OID:1.3.6.1.4.1.25623.1.0.812844
Version used: `2024-02-09T05:06:25Z`

Product Detection Result
Product: `cpe:/a:apache:http_server:2.4.25`
Method: `Apache HTTP Server Detection Consolidation`
OID: 1.3.6.1.4.1.25623.1.0.117232)

Critical (CVSS: 9.8)
NVT: Apache HTTP Server < 2.4.49 Multiple Vulnerabilities - Linux

Product detection result
`cpe:/a:apache:http_server:2.4.25`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.49
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.49 or later.

Affected Software/OS
Apache HTTP Server version 2.4.48 and prior.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2021-34798: NULL pointer dereference in httpd core
- CVE-2021-39275: ap_escape_quotes buffer overflow
- CVE-2021-40438: mod_proxy SSRF

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server < 2.4.49 Multiple Vulnerabilities - Linux`
OID:1.3.6.1.4.1.25623.1.0.146725
Version used: `2022-08-09T10:11:17Z`

Product Detection Result
Product: `cpe:/a:apache:http_server:2.4.25`
Method: `Apache HTTP Server Detection Consolidation`
OID: 1.3.6.1.4.1.25623.1.0.117232)

Critical (CVSS: 9.8)
NVT: Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux

Product detection result

cpe:/a:apache:http_server:2.4.25

. . . continues on next page . . .

. . . continued from previous page . . .

Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)

Summary
Apache HTTP Server is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.52
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.52 or later.

Affected Software/OS
Apache HTTP Server versions through 2.4.51.

Vulnerability Insight
A carefully crafted request body can cause a buffer overflow in the mod_lua multipart parser (r:parsebody() called from Lua scripts).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.48
Installation
path / port:       80/tcp
```

Impact

- CVE-2020-35452: A specially crafted Digest nonce can cause a stack overflow in mod_auth_digest.
- CVE-2021-26690: A specially crafted Cookie header handled by mod_session can cause a NULL pointer dereference and crash, leading to a possible Denial Of Service.
- CVE-2021-26691: A specially crafted SessionHeader sent by an origin server could cause a heap overflow.

Solution:

Solution type: VendorFix

. . . continues on next page . . .

. . . continued from previous page . . .

Update to version 2.4.48 or later.

Affected Software/OS
Apache HTTP Server versions 2.4.0 to 2.4.46 on Linux.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2020-35452: mod_auth_digest possible stack overflow by one null byte
- CVE-2021-26690: mod_session NULL pointer dereference
- CVE-2021-26691: mod_session response handling heap overflow

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.53
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 2.4.53 or later.

Affected Software/OS

Apache HTTP Server version 2.4.52 and prior.

Vulnerability Insight

The following vulnerabilities exist:

- CVE-2022-22719: mod_lua Use of uninitialized value of in r:parsebody
- CVE-2022-22720: HTTP request smuggling vulnerability
- CVE-2022-22721: Possible buffer overflow with very large or unlimited LimitXMLRequestBody
- CVE-2022-23943: mod_sed: Read/write beyond bounds

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.54
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.54 or later.

Affected Software/OS
Apache HTTP Server version 2.4.53 and prior.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2022-26377: mod_proxy_ajp: Possible request smuggling
- CVE-2022-28614: Read beyond bounds via ap_rwrite()
- CVE-2022-28615: Read beyond bounds in ap_strcmp_match()
- CVE-2022-29404: Denial of service in mod_lua r:parsebody
- CVE-2022-30556: Information disclosure in mod_lua with websockets
- CVE-2022-31813: mod_proxy X-Forwarded-For dropped by hop-by-hop mechanism

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Solution:
Solution type: VendorFix
Update to version 2.4.60 or later.

Affected Software/OS
Apache HTTP Server version 2.4.59 and prior.

Vulnerability Insight
The following flaws exist:
- CVE-2024-36387: Denial of Service (DoS) by Null pointer in websocket over HTTP/2
- CVE-2024-38473: Proxy encoding problem
- CVE-2024-38474: Weakness with encoded question marks in backreferences
- CVE-2024-38475: Weakness in mod_rewrite when first segment of substitution matches filesystem path
- CVE-2024-38476: May use exploitable/malicious backend application output to run local handlers via internal redirect
- CVE-2024-38477: Crash resulting in DoS in mod_proxy via a malicious request
- CVE-2024-39573: mod_rewrite proxy handler substitution

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a HTTP request smuggling vulnerability.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.56
Installation
path / port:       80/tcp
```

Impact

Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

Solution:

Solution type: VendorFix

Update to version 2.4.56 or later.

Affected Software/OS

Apache HTTP Server versions 2.4.0 through 2.4.55.

Vulnerability Insight

Some mod_proxy configurations allow a HTTP Request Smuggling attack.

Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux`

cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a memory access vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.41
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 2.4.41 or later.

Affected Software/OS

Apache HTTP Server version 2.4.18 to 2.4.39.

Vulnerability Insight

Using fuzzed network input, the http/2 session handling could be made to read memory after being freed during connection shutdown.

Installation
path / port:       80/tcp
```

. . . continues on next page . . .

. . . continued from previous page . . .

Impact
Successful exploitation will allow remote attackers to cause the target service to crash. A remote user can obtain potentially sensitive information as well on the target system.

Solution:
Solution type: VendorFix
Update to Apache HTTP Server 2.2.34 or 2.4.27 or later.

Affected Software/OS
Apache HTTP Server 2.2.x before 2.2.34 and 2.4.x before 2.4.27.

Vulnerability Insight
The flaw exists due to error in Apache 'mod_auth_digest' which does not properly initialize memory used to process 'Digest' type HTTP Authorization headers.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux`

NVT: phpMyAdmin End of Life (EOL) Detection - Linux

Summary
The phpMyAdmin version on the remote host has reached the End of Life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "phpMyAdmin" version on the remote host has reached the end of life.
CPE:                cpe:/a:phpmyadmin:phpmyadmin:4.8.5
Installed version:  4.8.5
Location/URL:       /
EOL version:        4.8
EOL date:           2019-06-04
```

Impact
An EOL version of phpMyAdmin is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: VendorFix
Update the phpMyAdmin version on the remote host to a still supported version.

Vulnerability Detection Method
Checks if an EOL version is present on the target host.
Details: `phpMyAdmin End of Life (EOL) Detection - Linux`
OID:1.3.6.1.4.1.25623.1.0.113015
Version used: `2025-04-15T05:54:49Z`

NVT: PHP End of Life (EOL) Detection - Linux

Product detection result
`cpe:/a:php:php:7.2.14`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
The PHP version on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "PHP" version on the remote host has reached the end of life.
CPE:                cpe:/a:php:php:7.2.14
Installed version: 7.2.14
EOL version:        7.2
EOL date:           2020-11-30
```

Impact
An EOL version of PHP is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: VendorFix
Update the PHP version on the remote host to a still supported version.

Vulnerability Insight
Each release branch of PHP is fully supported for two years from its initial stable release. During this period, bugs and security issues that have been reported are fixed and are released in regular point releases.
After this two year period of active support, each branch is then supported for an additional year for critical security issues only. Releases during this period are made on an as-needed basis: there may be multiple point releases, or none, depending on the number of reports.
Once the three years of support are completed, the branch reaches its end of life and is no longer supported.

Vulnerability Detection Method
Checks if an EOL version is present on the target host.
Details: `PHP End of Life (EOL) Detection - Linux`

Product detection result
cpe:/a:php:php:7.2.14
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 7.2.14
Fixed version: 7.2.16
Installation
path / port: 80/tcp

Solution:
Solution type: VendorFix
Update to version 7.1.27, 7.2.16, 7.3.3 or later.

Affected Software/OS
PHP version 7.x before 7.1.27, 7.2.x before 7.2.16 and 7.3.x before 7.3.3.

Vulnerability Insight
PHP is prone to multiple vulnerabilities:
- Due to the way rename() across filesystems is implemented, it is possible that file being renamed is briefly available with wrong permissions while the rename is ongoing, thus enabling unauthorized users to access the data. (CVE-2019-9637)
- Uninitialized read in exif_process_IFD_in_MAKERNOTE because of mishandling the maker_note->offset relationship to value_len (CVE-2019-9638)
- Uninitialized read in exif_process_IFD_in_MAKERNOTE because of mishandling the data_len variable (CVE-2019-9639)
- Invalid Read in exif_process_SOFn (CVE-2019-9640)
- Uninitialized read in exif_process_IFD_in_TIFF (CVE-2019-9641)

. . . continues on next page . . .

NVT: phpMyAdmin < 4.9.6, 5.x < 5.0.3 Multiple Vulnerabilities (PMASA-2020-5, PMASA-2020-6) - Linux

Summary
phpMyAdmin is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Installed version: 4.8.5
Fixed version:     4.9.6
Installation
path / port:       /
```

Impact

Successful exploitation would allow an attacker to:
- If an attacker sends a crafted link to the victim with the malicious JavaScript, when the victim clicks on the link, the JavaScript will run and complete the instructions made by the attacker (CVE-2020-26934)
- An attacker could use this flaw to inject malicious SQL in to a query (CVE-2020-26935)

Solution:
Solution type: VendorFix
Update to version 4.9.6, 5.0.3 or later.

Affected Software/OS

phpMyAdmin prior to version 4.9.6 and 5.x prior to 5.0.3.

Vulnerability Insight

The following vulnerabilities exist:
- XSS relating to the transformation feature (CVE-2020-26934)
- SQL injection vulnerability in SearchController (CVE-2020-26935)

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.
Details: `phpMyAdmin < 4.9.6, 5.x < 5.0.3 Multiple Vulnerabilities (PMASA-2020-5, PMASA-2.`

Critical (CVSS: 9.8)
NVT: phpMyAdmin < 4.9.2 Multiple Vulnerabilities (PMASA-2019-5) - Linux

Summary
phpMyAdmin is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 4.8.5
Fixed version:     4.9.2
Installation
path / port:       /
```

Solution:
Solution type: VendorFix
Update to version 4.9.2 or later.

Affected Software/OS
phpMyAdmin prior to version 4.9.2.

Vulnerability Insight
phpMyAdmin is prone to multiple vulnerabilities:
- SQL injection vulnerability (CVE-2019-18622)
- Certain Git information is not escaped (CVE-2019-19617)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `phpMyAdmin < 4.9.2 Multiple Vulnerabilities (PMASA-2019-5) - Linux`

Product detection result

```
cpe:/a:php:php:7.2.14
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.2.14
Fixed version:     8.1.31
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.1.31, 8.2.26, 8.3.14 or later.

Affected Software/OS

PHP versions prior to 8.1.31, 8.2.x prior to 8.2.26 and 8.3.x prior to 8.3.14.

Vulnerability Insight

The following vulnerabilities exist:

. . . continues on next page . . .

. . . continued from previous page . . .

- CVE-2024-8929: Leak partial content of the heap through heap buffer over-read
- CVE-2024-8932: OOB access in ldap_escape
- CVE-2024-11233: Single byte overread with convert.quoted-printable-decode filter
- CVE-2024-11234: Configuring a proxy in a stream context might allow for CRLF injection in URIs
- CVE-2024-11236: Integer overflow in the firebird/dblib quoter causing OOB writes
- No CVE: Heap-Use-After-Free in sapi_read_post_data Processing in CLI SAPI Interface

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: PHP < 7.1.33, 7.2.x < 7.2.24, 7.3.x < 7.3.11 RCE Vulnerability - Version Check

Product detection result
`cpe:/a:php:php:7.2.14`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

. . . continues on next page . . .

. . . continued from previous page . . .

Summary
PHP is prone to a remote code execution (RCE) vulnerability in certain nginx + php-fpm configurations.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.2.14
Fixed version:     7.2.24
Installation
path / port:       80/tcp
```

Impact
Successful exploitation would allow an unauthenticated remote attacker to execute arbitrary code on the target machine.

Solution:
Solution type: VendorFix
Update to version 7.1.33, 7.2.24, 7.3.11 or later.
As an alternative a workaround to update the nginx configuration to mitigate this vulnerability is described at the PHP.net bugtracker linked in the references.

Affected Software/OS
PHP prior to version 7.1.33, 7.2.x prior to 7.2.24 and 7.3.x prior to 7.3.11.

Vulnerability Insight
The file sapi/fpm/fpm/fpm_main.c contains pointer arithmetic that assumes that env_path_info has a prefix equal to the path to the php script. However, the code does not check this assumption is satisfied. The absence of the check can lead to an invalid pointer in the 'path_info' variable.
Such conditions can be achieved in a pretty standard Nginx configuration. The regexp in 'fastcgi_split_path_info' directive can be broken using the newline character (in encoded form, %0a). Broken regexp leads to empty PATH_INFO, which triggers the bug.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 7.1.33, 7.2.x < 7.2.24, 7.3.x < 7.3.11 RCE Vulnerability - Version Check`

Summary
PHP is prone to an information disclosure and a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 7.2.14
Fixed version:     7.2.18
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 7.1.29, 7.2.18, 7.3.5 or later.

Affected Software/OS
PHP versions 7.1.x prior to 7.1.29, 7.2.x prior to 7.2.18 and 7.3.x prior to 7.3.5.

Vulnerability Insight
When processing certain files, PHP EXIF extension can be caused to read past allocated buffer in exif_process_IFD_TAG function. This may lead to information disclosure or crash.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP 7.1.x < 7.1.29, 7.2.x < 7.2.18, 7.3.x < 7.3.5 Information Disclosure / DoS . ↪..`

Product detection result

```
cpe:/a:php:php:7.2.14
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.2.14
Fixed version:     7.2.19
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 7.1.30, 7.2.19, 7.3.6 or later.

Affected Software/OS

PHP versions 7.1.x prior to 7.1.30, 7.2.x prior to 7.2.19 and 7.3.x prior to 7.3.6.

Vulnerability Insight

The following flaws exist:

- CVE-2019-11038: When using the gdImageCreateFromXbm() function in the GD Graphics Library (aka LibGD) 2.2.5, as used in the PHP GD extension it is possible to supply data that will cause the function to use the value of uninitialized variable. This may lead to disclosing contents of the stack that has been left there by previous code.

- CVE-2019-11039: Function iconv_mime_decode_headers() may perform out-of-buffer read due to integer overflow when parsing MIME headers. This may lead to information disclosure or crash.

. . . continues on next page . . .

. . . continued from previous page . . .

- CVE-2019-11040: When PHP EXIF extension is parsing EXIF information from an image, e.g. via exif_read_data() function it is possible to supply it with data what will cause it to read past the allocated buffer. This may lead to information disclosure or crash.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP 7.1.x < 7.1.30, 7.2.x < 7.2.19, 7.3.x < 7.3.6 Multiple Vulnerabilities - Li.`

2.31.2 High 80/tcp

High (CVSS: 8.8)
NVT: phpMyAdmin <= 5.1.1 CSV Injection Vulnerability - Linux

Summary
phpMyAdmin is prone to a CSV injection vulnerability via Export Section.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 4.8.5
Fixed version:     None
Installation
path / port:       /
```

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
phpMyAdmin version 5.1.1 and prior.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
NOTE: the vendor disputes this because 'the CSV file is accurately generated based on the database contents.'
Nevertheless the vendor could implement measures while doing the CSV export which could lower or mitigate the risk originating from this flaw.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `phpMyAdmin <= 5.1.1 CSV Injection Vulnerability - Linux`

High (CVSS: 8.8)
NVT: phpMyAdmin < 4.9.4, 5.x < 5.0.1 SQL Injection Vulnerability (PMASA-2020-1) - Linux

Summary
phpMyAdmin is prone to an SQL injection vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 4.8.5
Fixed version:     4.9.4
Installation
path / port:       /
```

Impact
A malicious user could inject custom SQL in place of their own username when creating queries to this page. An attacker must have a valid MySQL account to access the server.

Solution:
Solution type: VendorFix
Update to version 4.9.4, 5.0.1 or later.

Affected Software/OS
phpMyAdmin prior to version 4.9.4 and 5.x prior to 5.0.1.

Vulnerability Insight
An SQL injection flaw has been discovered in the user accounts page.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `phpMyAdmin < 4.9.4, 5.x < 5.0.1 SQL Injection Vulnerability (PMASA-2020-1) - Li.`

cpe:/a:postgresql:postgresql:9.5.25
Detected by PostgreSQL Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.12802
↪5)

Summary
The PostgreSQL version on the remote host has reached the End of Life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
The "PostgreSQL" version on the remote host has reached the end of life.
CPE: cpe:/a:postgresql:postgresql:9.5.25
Installed version: 9.5.25
Location/URL: 5432/tcp
EOL version: 9.5
EOL date: 2021-02-11

Impact
An EOL version of PostgreSQL is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: VendorFix
Update the PostgreSQL version on the remote host to a still supported version.

Vulnerability Detection Method
Checks if an EOL version is present on the target host.
Details: PostgreSQL End of Life (EOL) Detection - Linux

Critical (CVSS: 10.0)
NVT: PostgreSQL Multiple Vulnerabilities (Aug 2025) - Linux

Product detection result
`cpe:/a:postgresql:postgresql:9.5.25`
`Detected by PostgreSQL Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.12802`
`↪5)`

Summary
PostgreSQL is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 9.5.25
Fixed version:     13.22
Installation
path / port:       5432/tcp
```

Solution:
Solution type: VendorFix
Update to version 13.22, 14.19, 15.14, 16.10, 17.6 or later.

Affected Software/OS
PostgreSQL prior to version 13.22, 14.x prior to 14.19, 15.x prior to 15.14, 16.x prior to 16.10 and 17.x prior to 17.6.

Vulnerability Insight
The following flaws exist:
- CVE-2025-8713: Optimizer statistics can expose sampled data within a view, partition, or child table
- CVE-2025-8714: pg_dump lets superuser of origin server execute arbitrary code in psql client
- CVE-2025-8715: pg_dump newline in object name executes arbitrary code in psql client and in restore target server

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

cpe:/a:postgresql:postgresql:9.5.25
Detected by PostgreSQL Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.12802
↪5)
```

Summary

PostgreSQL is prone to an SQL injection vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 9.5.25
Fixed version:     10.6
Installation
path / port:       5432/tcp
```

Solution:

Solution type: VendorFix

Update to version 10.6 or 11.1 respectively.

Affected Software/OS

PostgreSQL before versions 10.6 and 11.1.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

A SQL Injection flaw has been discovered in PostgreSQL server in the way triggers that enable transition relations are dumped. The transition relation name is not correctly quoted and it may allow an attacker with CREATE privilege on some non-temporary schema or TRIGGER privilege on some table to create a malicious trigger that, when dumped and restored, would result in additional SQL statements being executed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PostgreSQL < 10.6, 11.x < 11.1 SQL Injection Vulnerability - Linux`

```

Summary
Oracle MySQL is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 5.5.60
Fixed version:     See reference
Installation
```

. . . continues on next page . . .

. . . continued from previous page . . .

path / port: 3306/tcp

Impact
Successful exploitation will allow remote attackers to have an impact on confidentiality, integrity and availability.

Solution:
Solution type: VendorFix
The vendor has released updates. Please see the references for more information.

Affected Software/OS
Oracle MySQL version 5.5.x through 5.5.61, 5.6.x through 5.6.41, 5.7.x through 5.7.23 and 8.0.x through 8.0.12.

Vulnerability Insight
Multiple flaws exist due to:
- An unspecified error within 'InnoDB (zlib)' component of MySQL Server.
- An unspecified error within 'Server: Parser' component of MySQL Server.
- An unspecified error within 'Client programs' component of MySQL Server.
- An unspecified error within 'Server: Storage Engines' component of MySQL Server.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: Oracle MySQL Server <= 5.7.35 / 8.0 <= 8.0.26 Security Update (cpuoct2021) - Linux

Product detection result
cpe:/a:mysql:mysql:5.5.60-
Detected by MariaDB / Oracle MySQL Detection (MySQL Protocol) (OID: 1.3.6.1.4.1.
↪25623.1.0.100152)

Summary
Oracle MySQL Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 5.5.60
Fixed version: 5.7.36
Installation
path / port: 3306/tcp

Solution:
Solution type: VendorFix
Update to version 5.7.36, 8.0.27 or later.

Affected Software/OS
Oracle MySQL Server version 5.7.35 and prior and 8.0 through 8.0.26.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: Oracle MySQL Server <= 5.7.35 / 8.0 <= 8.0.26 Security Update (cpuoct2021) - Li.

[return to 172.30.9.3]

2.33.2 Critical 80/tcp

Critical (CVSS: 10.0)
NVT: phpMyAdmin End of Life (EOL) Detection - Linux

Summary
The phpMyAdmin version on the remote host has reached the End of Life (EOL) and should not be used anymore.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "phpMyAdmin" version on the remote host has reached the end of life.
CPE:                cpe:/a:phpmyadmin:phpmyadmin:3.5.2.2
Installed version:  3.5.2.2
Location/URL:       /phpmyadmin
EOL version:        3.5
EOL date:           unknown
```

Impact

An EOL version of phpMyAdmin is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:

Solution type: VendorFix

Update the phpMyAdmin version on the remote host to a still supported version.

Vulnerability Detection Method

Checks if an EOL version is present on the target host.

Details: `phpMyAdmin End of Life (EOL) Detection - Linux`

OID:1.3.6.1.4.1.25623.1.0.113015

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

The PHP version on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

. . . continues on next page . . .

. . . continued from previous page . . .

```
The "PHP" version on the remote host has reached the end of life.
CPE:                cpe:/a:php:php:5.5.9
Installed version: 5.5.9
EOL version:        5.5
EOL date:           2016-07-21
```

Impact
An EOL version of PHP is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: VendorFix
Update the PHP version on the remote host to a still supported version.

Vulnerability Insight
Each release branch of PHP is fully supported for two years from its initial stable release. During this period, bugs and security issues that have been reported are fixed and are released in regular point releases.
After this two year period of active support, each branch is then supported for an additional year for critical security issues only. Releases during this period are made on an as-needed basis: there may be multiple point releases, or none, depending on the number of reports.
Once the three years of support are completed, the branch reaches its end of life and is no longer supported.

Vulnerability Detection Method
Checks if an EOL version is present on the target host.
Details: `PHP End of Life (EOL) Detection - Linux`

NVT: phpMyAdmin < 4.8.6 SQL Injection Vulnerability (PMASA-2019-3) - Linux

Summary

phpMyAdmin is prone to an SQL injection vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.5.2.2
Fixed version:     4.8.6
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
Installation
path / port:        /phpmyadmin
```

Solution:
Solution type: VendorFix
Update to version 4.8.6 or later.

Affected Software/OS
phpMyAdmin prior to version 4.8.6.

Vulnerability Insight
A vulnerability was reported where a specially crafted database name can be used to trigger an SQL injection attack through the designer feature.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `phpMyAdmin < 4.8.6 SQL Injection Vulnerability (PMASA-2019-3) - Linux`

`cpe:/a:apache:http_server:2.4.7`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.60
Installation
path / port:       80/tcp
```

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to version 2.4.60 or later.

Affected Software/OS
Apache HTTP Server version 2.4.59 and prior.

Vulnerability Insight
The following flaws exist:
- CVE-2024-36387: Denial of Service (DoS) by Null pointer in websocket over HTTP/2
- CVE-2024-38473: Proxy encoding problem
- CVE-2024-38474: Weakness with encoded question marks in backreferences
- CVE-2024-38475: Weakness in mod_rewrite when first segment of substitution matches filesystem path
- CVE-2024-38476: May use exploitable/malicious backend application output to run local handlers via internal redirect
- CVE-2024-38477: Crash resulting in DoS in mod_proxy via a malicious request
- CVE-2024-39573: mod_rewrite proxy handler substitution

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Summary

PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
Fixed version:     5.6.29
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 5.6.29, 7.0.14 or later.

Affected Software/OS
PHP versions prior to 5.6.29 and 7.0.x prior to 7.0.14.

Vulnerability Insight
The php_wddx_push_element function in ext/wddx/wddx.c allows remote attackers to cause a denial of service (out-of-bounds read and memory corruption) or possibly have unspecified other impact via an empty boolean element in a wddxPacket XML document.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.29, 7.0.x < 7.0.14 DoS Vulnerability - Linux`
OID:1.3.6.1.4.1.25623.1.0.117803
Version used: `2025-09-24T05:39:03Z`

Product Detection Result
Product: `cpe:/a:php:php:5.5.9`
Method: `PHP Detection Consolidation`
OID: 1.3.6.1.4.1.25623.1.0.171722)

Critical (CVSS: 9.8)
NVT: phpMyAdmin < 4.9.2 Multiple Vulnerabilities (PMASA-2019-5) - Linux

Summary
phpMyAdmin is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.5.2.2
Fixed version:     4.9.2
Installation
path / port:       /phpmyadmin
```

Solution:
Solution type: VendorFix
Update to version 4.9.2 or later.

Affected Software/OS
phpMyAdmin prior to version 4.9.2.

Vulnerability Insight
phpMyAdmin is prone to multiple vulnerabilities:
- SQL injection vulnerability (CVE-2019-18622)
- Certain Git information is not escaped (CVE-2019-19617)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `phpMyAdmin < 4.9.2 Multiple Vulnerabilities (PMASA-2019-5) - Linux`
OID:1.3.6.1.4.1.25623.1.0.143167

Critical (CVSS: 9.8)
NVT: PHP < 5.4.45, 5.5.x < 5.5.29, 5.6.x < 5.6.13 Multiple Vulnerabilities (Jul 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.29
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to read arbitrary empty directories, also to cause a denial of service.

Solution:

Solution type: VendorFix

Update to version 5.4.45, 5.5.29, 5.6.13 or later.

Affected Software/OS

PHP prior to version 5.4.45, 5.5.x prior to 5.5.29 and 5.6.x prior to 5.6.13 on Linux.

Vulnerability Insight

The following flaws exist:
- Error in the 'ZipArchive::extractTo' function in 'ext/zip/php_zip.c' script.
- The xsl_ext_function_php function in ext/xsl/xsltprocessor.c when libxml2 is used, does not consider the possibility of a NULL valuePop return value before proceeding with a free operation after the principal argument loop.
- Improper handling of multiple php_var_unserialize calls
- Multiple use-after-free vulnerabilities

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

. . . continues on next page . . .

. . . continued from previous page . . .

Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.48
Installation
path / port:       80/tcp
```

Impact
- CVE-2020-35452: A specially crafted Digest nonce can cause a stack overflow in mod_auth_digest.
- CVE-2021-26690: A specially crafted Cookie header handled by mod_session can cause a NULL pointer dereference and crash, leading to a possible Denial Of Service.
- CVE-2021-26691: A specially crafted SessionHeader sent by an origin server could cause a heap overflow.

Solution:
Solution type: VendorFix
Update to version 2.4.48 or later.

Affected Software/OS
Apache HTTP Server versions 2.4.0 to 2.4.46 on Linux.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2020-35452: mod_auth_digest possible stack overflow by one null byte
- CVE-2021-26690: mod_session NULL pointer dereference
- CVE-2021-26691: mod_session response handling heap overflow

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: PHP < 7.1.33, 7.2.x < 7.2.24, 7.3.x < 7.3.11 RCE Vulnerability - Version Check

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a remote code execution (RCE) vulnerability in certain nginx + php-fpm configurations.

Quality of Detection (QoD): 30%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     7.1.33
Installation
path / port:       80/tcp
```

Impact

Successful exploitation would allow an unauthenticated remote attacker to execute arbitrary code on the target machine.

Solution:

Solution type: VendorFix

Update to version 7.1.33, 7.2.24, 7.3.11 or later.

As an alternative a workaround to update the nginx configuration to mitigate this vulnerability is described at the PHP.net bugtracker linked in the references.

Affected Software/OS

PHP prior to version 7.1.33, 7.2.x prior to 7.2.24 and 7.3.x prior to 7.3.11.

Vulnerability Insight

The file sapi/fpm/fpm/fpm_main.c contains pointer arithmetic that assumes that env_path_info has a prefix equal to the path to the php script. However, the code does not check this assumption is satisfied. The absence of the check can lead to an invalid pointer in the 'path_info' variable.

Such conditions can be achieved in a pretty standard Nginx configuration. The regexp in 'fastcgi_split_path_info' directive can be broken using the newline character (in encoded form, %0a). Broken regexp leads to empty PATH_INFO, which triggers the bug.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: PHP < 5.5.27, 5.6.x < 5.6.11 Arbitrary Code Execution Vulnerability (Aug 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to an arbitrary code execution vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.27
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to execute arbitrary code by triggering a failed SplMinHeap::compare operation.

Solution:

Solution type: VendorFix

Update to version 5.5.27, 5.6.11 or later.

Affected Software/OS

PHP prior to version 5.5.27 and 5.6.x prior to 5.6.11 on Linux.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

An use-after-free vulnerability occurs in the 'spl_ptr_heap_insert' function in 'ext/spl/spl_heap.c'.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.27, 5.6.x < 5.6.11 Arbitrary Code Execution Vulnerability (Aug 2016) . ↪..`
OID:1.3.6.1.4.1.25623.1.0.808671

. . . continued from previous page . . .

```
Fixed version:     8.1.31
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.1.31, 8.2.26, 8.3.14 or later.

Affected Software/OS
PHP versions prior to 8.1.31, 8.2.x prior to 8.2.26 and 8.3.x prior to 8.3.14.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2024-8929: Leak partial content of the heap through heap buffer over-read
- CVE-2024-8932: OOB access in ldap_escape
- CVE-2024-11233: Single byte overread with convert.quoted-printable-decode filter
- CVE-2024-11234: Configuring a proxy in a stream context might allow for CRLF injection in URIs
- CVE-2024-11236: Integer overflow in the firebird/dblib quoter causing OOB writes
- No CVE: Heap-Use-After-Free in sapi_read_post_data Processing in CLI SAPI Interface

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: Apache HTTP Server Multiple Vulnerabilities (Apr 2018) - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.30
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow an attacker to replay HTTP requests across servers without detection, influence the user content, upload a malicious file, crash the Apache HTTP Server and perform denial of service attack.

Solution:

Solution type: VendorFix

Update to version 2.4.30 or later. Please see the references for more information.

Affected Software/OS

. . . continues on next page . . .

. . . continued from previous page . . .

Apache HTTP Server versions from 2.4.1 to 2.4.4, 2.4.6, 2.4.7, 2.4.9, 2.4.10, 2.4.12, 2.4.16 to 2.4.18, 2.4.20, 2.4.23, 2.4.25 to 2.4.29.

Vulnerability Insight
Multiple flaws exist due to:
- Apache HTTP Server fails to correctly generate the nonce sent to prevent reply attacks.
- Misconfigured mod_session variable, HTTP_SESSION.
- Apache HTTP Server fails to sanitize the expression specified in '<FilesMatch>'.
- An error in Apache HTTP Server 'mod_authnz_ldap' when configured with AuthLDAPCharsetConfig.
- Apache HTTP Server fails to sanitize against a specially crafted request.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: PHP 5.x < 5.6.34, 7.x < 7.0.28, 7.1.x < 7.1.15, 7.2.x < 7.2.3 Stack Buffer Overflow Vulnerability (Mar 2018) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a stack buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.34
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow an attacker to execute arbitrary code in the context of the affected application. Failed exploit attempts will result in denial-of-service conditions.

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to version 5.6.34, 7.0.28, 7.1.15, 7.2.3 or later.

Affected Software/OS
PHP versions 5.x prior to 5.6.34, 7.x prior to 7.0.28, 7.1.x prior to 7.1.15 and 7.2.x prior to 7.2.3 on Linux.

Vulnerability Insight
The flaw exists because php fails to adequately bounds-check user-supplied data before copying it into an insufficiently sized buffer.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP 5.x < 5.6.34, 7.x < 7.0.28, 7.1.x < 7.1.15, 7.2.x < 7.2.3 Stack Buffer Over. ↪..`

NVT: PHP < 5.6.26, 7.x < 7.0.11 Multiple Vulnerabilities (Sep 2016) - Linux

. . . continues on next page . . .

. . . continued from previous page . . .

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.26
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting this issue allow remote attackers to cause a denial of service, or possibly have unspecified other impact.

Solution:
Solution type: VendorFix
Update to version 5.6.26, 7.0.11 or later.

Affected Software/OS
PHP prior to version 5.6.26 and 7.x prior to 7.0.11 on Linux.

Vulnerability Insight
The following flaws exist:
- Use-after-free vulnerability in the 'wddx_stack_destroy' function in 'ext/wddx/wddx.c' script.
- Improper verification of a BIT field has the UNSIGNED_FLAG flag in 'ext/mysqlnd/mysqlnd_wireprotocol.c' script.
- The ZIP signature-verification feature does not ensure that the uncompressed_filesize field is large enough.
- The script 'ext/spl/spl_array.c' proceeds with SplArray unserialization without validating a return value and data type.
- The script 'ext/intl/msgformat/msgformat_format.c' does not properly restrict the locale length provided to the Locale class in the ICU library.
- An error in the php_wddx_push_element function in ext/wddx/wddx.c.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.26, 7.x < 7.0.11 Multiple Vulnerabilities (Sep 2016) - Linux`

Critical (CVSS: 9.8)
NVT: PHP < 5.5.37, 5.6.x < 5.6.23 Multiple Vulnerabilities (Aug 2016) - Linux

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.37
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to cause a denial of service (use-after-free and application crash) or possibly execute arbitrary code or possibly have unspecified other impact via a large integer argument.

Solution:
Solution type: VendorFix
Update to version 5.5.37, 5.6.23 or later.

Affected Software/OS
PHP prior to version 5.5.37 and 5.6.x prior to 5.6.23 on Linux.

Vulnerability Insight
The following flaws exist:
- The 'spl_array.c' in the SPL extension improperly interacts with the unserialize implementation and garbage collection.
- Integer overflow in the 'SplFileObject::fread' function in 'spl_directory.c' in the SPL extension.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.37, 5.6.x < 5.6.23 Multiple Vulnerabilities (Aug 2016) - Linux`

NVT: Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.52
Installation
path / port:       80/tcp
```

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to version 2.4.52 or later.

Affected Software/OS
Apache HTTP Server versions through 2.4.51.

Vulnerability Insight
A carefully crafted request body can cause a buffer overflow in the mod_lua multipart parser (r:parsebody() called from Lua scripts).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux`

Critical (CVSS: 9.8)
NVT: PHP < 5.5.33, 5.6.x < 5.6.19 Multiple Vulnerabilities (Apr 2016) - Linux

Product detection result
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 5.5.9
Fixed version: 5.5.33
Installation
path / port: 80/tcp

Impact
Successfully exploiting these issues allow remote attackers to gain access to potentially sensitive information and conduct a denial of service (memory corruption and application crash).

Solution:
Solution type: VendorFix
Update to PHP version 5.5.33, 5.6.19 or later.

Affected Software/OS
PHP prior to version 5.5.33 and 5.6.x prior to 5.6.19 on Linux.

Vulnerability Insight
The following flaws exist:
- Use-after-free error in wddx.c script in the WDDX extension in PHP
- Error in the phar_parse_zipfile function in zip.c script in the PHAR extension in PHP.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.26
Installation
path / port:       80/tcp
```

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

Successful exploitation will allow remote attackers to bypass authentication and perform unauthorized actions, cause a denial-of-service condition and gain access to potentially sensitive information.

Solution:
Solution type: VendorFix
Update to Apache HTTP Server 2.2.33 or 2.4.26 or later.

Affected Software/OS
Apache HTTP Server 2.2.x before 2.2.33 and 2.4.x before 2.4.26.

Vulnerability Insight
Multiple flaws exist as,
- The mod_mime can read one byte past the end of a buffer when sending a malicious Content-Type response header.
- The mod_ssl may dereference a NULL pointer when third-party modules call ap_hook_process_connection() during an HTTP request to an HTTPS port.
- An use of the ap_get_basic_auth_pw() by third-party modules outside of the authentication phase may lead to authentication requirements being bypassed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server Multiple Vulnerabilities (Jun 2017) - Linux`

Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.28
Installation
path / port:       80/tcp
```

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

Successfully exploiting this issue allow remote attackers to cause a denial of service (NULL pointer dereference and application crash) or trigger unintended method execution to defeat cryptographic protection mechanisms.

Solution:
Solution type: VendorFix
Update to version 5.4.44, 5.5.28, 5.6.12 or later.

Affected Software/OS
PHP prior to version 5.4.44, 5.5.x prior to 5.5.28 and 5.6.x prior to 5.6.12 on Linux.

Vulnerability Insight
Multiple flaws exist due to:
- An improper validation of certain Exception objects in 'Zend/zend_exceptions.c' script.
- The 'openssl_random_pseudo_bytes' function in 'ext/openssl/openssl.c' incorrectly relies on the deprecated 'RAND_pseudo_bytes' function.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: PHP < 5.5.37, 5.6.x < 5.6.23, 7.x < 7.0.8 Multiple Vulnerabilities (Aug 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.37
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to cause a denial of service (buffer overflow and application crash) or possibly execute arbitrary code.

Solution:

Solution type: VendorFix

Update to PHP version 5.5.37, 5.6.23, 7.0.8 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
PHP prior to version 5.5.37, 5.6.x prior to 5.6.23 and 7.x prior to 7.0.8 on Linux.

Vulnerability Insight
The following flaws exist:
- The 'php_zip.c' script in the zip extension improperly interacts with the unserialize implementation and garbage collection.
- The php_wddx_process_data function in 'wddx.c' script in the WDDX extension mishandled data in a wddx_deserialize call.
- The multiple integer overflows in 'mcrypt.c' script in the mcrypt extension.
- The double free vulnerability in the '_php_mb_regex_ereg_replace_exec' function in 'php_mbregex.c' script in the mbstring extension.
- An integer overflow in the '_gd2GetHeader' function in 'gd_gd2.c' script in the GD Graphics Library.
- An integer overflow in the 'gdImageCreate' function in 'gd.c' script in the GD Graphics Library.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

```

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

Successfully exploiting these issues allow remote attackers to cause a denial of service, to obtain sensitive information from process memory and to execute arbitrary code via crafted dimensions.

Solution:
Solution type: VendorFix
Update to version 5.4.40, 5.5.24, 5.6.8 or later.

Affected Software/OS
PHP prior to version 5.4.40, 5.5.x prior to 5.5.24 and 5.6.x prior to 5.6.8.

Vulnerability Insight
The following flaws exist:
- Multiple stack-based buffer overflows in the 'phar_set_inode' function in phar_internal.h script in PHP.
- Vulnerabilities in 'phar_parse_metadata' and 'phar_parse_pharfile' functions in ext/phar/phar.c script in PHP.
- A NULL pointer dereference flaw in the 'build_tablename' function in 'ext/pgsql/pgsql.c' script that is triggered when handling NULL return values for 'token'

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.4.40, 5.5.x < 5.5.24, 5.6.x < 5.6.8 Multiple Vulnerabilities - Linux`

cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.35
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to cause a denial of service (out-of-bounds read) or possibly have unspecified other impact.

Solution:

Solution type: VendorFix

Update to version 5.5.35, 5.6.21, 7.0.6 or later.

Affected Software/OS

PHP prior to version 5.5.35, 5.6.x prior to 5.6.21 and 7.x prior to 7.0.6 on Linux.

Vulnerability Insight

The following flaws exist:

- Improper validation of TIFF start data in 'exif_process_TIFF_in_JPEG' function in 'ext/exif/exif.c' script.

- Improper validation of IFD sizes in 'exif_process_TIFF_in_JPEG' function in 'ext/exif/exif.c' script.

- Improper construction of spprintf arguments, in 'exif_process_TIFF_in_JPEG' function in 'ext/exif/exif.c' script.

. . . continues on next page . . .

. . . continued from previous page . . .

- Error in 'grapheme_strpos function' in 'ext/intl/grapheme/grapheme_string.c'.
- Error in 'xml_parse_into_struct' function in 'ext/xml/xml.c' script.
- The 'bcpowmod' function in 'ext/bcmath/bcmath.c' improperly modifies certain data structures.
- Improper validation of input passed to 'bcpowmod' function in 'ext/bcmath/bcmath.c' script.
- Error in 'grapheme_strpos' function in ext/intl/grapheme/grapheme_string.c script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.40
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 5.6.40, 7.1.16, 7.2.14, 7.3.1 or later.

Affected Software/OS

PHP versions before 5.6.40, 7.x before 7.1.26, 7.2.x before 7.2.14 and 7.3.x before 7.3.1.

Vulnerability Insight

The following flaws exist:
- Fixed bug #77269 (efree() on uninitialized Heap data in imagescale leads to use-after-free). (CVE-2016-10166)
- Fixed bug #77270 (imagecolormatch Out Of Bounds Write on Heap). (CVE-2019-6977)
- Fixed bug #77370 (Buffer overflow on mb regex functions - fetch_token). (CVE-2019-9023)
- Fixed bug #77371 (heap buffer overflow in mb regex functions - compile_string_node). (CVE-2019-9023)
- Fixed bug #77381 (heap buffer overflow in multibyte match_at). (CVE-2019-9023)
- Fixed bug #77382 (heap buffer overflow due to incorrect length in expand_case_fold_string). (CVE-2019-9023)
- Fixed bug #77385 (buffer overflow in fetch_token). (CVE-2019-9023)
- Fixed bug #77394 (Buffer overflow in multibyte case folding - unicode). (CVE-2019-9023)
- Fixed bug #77418 (Heap overflow in utf32be_mbc_to_code). (CVE-2019-9023)

. . . continues on next page . . .

. . . continued from previous page . . .

- Fixed bug #77247 (heap buffer overflow in phar_detect_phar_fname_ext). (CVE-2019-9021)
- Fixed bug #77242 (heap out of bounds read in xmlrpc_decode()). (CVE-2019-9020)
- Fixed bug #77380 (Global out of bounds read in xmlrpc base64 code). (CVE-2019-9024)

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `PHP Multiple Vulnerabilities (Feb 2019) - Linux`

OID:1.3.6.1.4.1.25623.1.0.142048

Version used: `2025-09-24T05:39:03Z`

Product Detection Result

Product: `cpe:/a:php:php:5.5.9`

Method: `PHP Detection Consolidation`

OID: 1.3.6.1.4.1.25623.1.0.171722)

Critical (CVSS: 9.8)
NVT: PHP < 5.5.38, 5.6.x < 5.6.24, 7.0.x < 7.0.9 Multiple Vulnerabilities (Jul 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.38
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues may allow attackers to cause a denial of service obtain sensitive information from process memory, or possibly have unspecified other impact.

Solution:

Solution type: VendorFix

Update to version 5.5.38, 5.6.24, 7.0.9 or later.

Affected Software/OS

PHP prior to version 5.5.38, 5.6.x prior to 5.6.24 and 7.x prior to 7.0.9.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
The following flaws exist:
- Integer overflow in the 'php_stream_zip_opener' function in 'ext/zip/zip_stream.c'
- Integer signedness error in the 'simplestring_addn' function in 'simplestring.c' in xmlrpc-epi
- 'ext/snmp/snmp.c' improperly interacts with the unserialize implementation and garbage collection
- The 'locale_accept_from_http' function in 'ext/intl/locale/locale_methods.c' does not properly restrict calls to the ICU 'uloc_acceptLanguageFromHTTP' function
- Error in the 'exif_process_user_comment' function of 'ext/exif/exif.c'
- Error in the 'exif_process_IFD_in_MAKERNOTE' function of 'ext/exif/exif.c'
- 'ext/session/session.c' does not properly maintain a certain hash data structure
- Integer overflow in the 'virtual_file_ex' function of 'TSRM/tsrm_virtual_cwd.c'
- Error in the 'php_url_parse_ex' function of 'ext/standard/url.c'
- Integer overflow error within _gdContributionsAlloc()
- Inadequate error handling in bzread()

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: PHP < 5.4.42, 5.5.x < 5.5.26, 5.6.x < 5.6.10 Multiple Vulnerabilities (Aug 2016) - Linux

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.26
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to cause a denial of service, to read or write to arbitrary files, also execute arbitrary code via a long reply to a LIST command, leading to a heap-based buffer overflow.

Solution:
Solution type: VendorFix
Update to version 5.4.42, 5.5.26, 5.6.10 or later.

Affected Software/OS
PHP prior to version 5.4.42, 5.5.x prior to 5.5.26 and 5.6.x prior to 5.6.10 on Linux.

Vulnerability Insight
The following flaws exist:
- Improper validation of token extraction for table names, in the php_pgsql_meta_data function in pgsql.c in the PostgreSQL extension.
- Integer overflow in the ftp_genlist function in ext/ftp/ftp.c
- PHP does not ensure that pathnames lack %00 sequences.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.4.42, 5.5.x < 5.5.26, 5.6.x < 5.6.10 Multiple Vulnerabilities (Aug 2016. ↪..`

NVT: PHP < 5.6.7 DoS Vulnerability - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.7
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to cause a denial of service.

Solution:

Solution type: VendorFix

Update to version 5.6.7 or later.

Affected Software/OS

PHP prior to version 5.6.7 on Linux.

Vulnerability Insight

The flaw is due to 'type confusion' issues in 'ext/soap/php_encoding.c', 'ext/soap/php_http.c', and 'ext/soap/soap.c' scripts.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `PHP < 5.6.7 DoS Vulnerability - Linux`

NVT: PHP < 5.5.34, 5.6.x < 5.6.20, 7.x < 7.0.5 Multiple Vulnerabilities (Jul 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.34
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to cause a denial of service (buffer overflow and application crash) or possibly execute arbitrary code.

Solution:

Solution type: VendorFix

Update to version 5.5.34, 5.6.20, 7.0.5 or later.

Affected Software/OS

PHP prior to version 5.5.34, 5.6.x prior to 5.6.20 and 7.0.x prior to 7.0.5 on Linux.

Vulnerability Insight

The following flaws exist:

- Multiple integer overflows in the mbfl_strcut function in 'ext/mbstring/libmbfl/mbfl/mbfilter.c' script.
- Format string vulnerability in the php_snmp_error function in 'ext/snmp/snmp.c' script.
- An improper handling of '\0' characters by the 'phar_analyze_path' function in 'ext/phar/phar.c' script.
- An integer overflow in the 'php_raw_url_encode' function in 'ext/standard/url.c' script.

. . . continues on next page . . .

. . . continued from previous page . . .

- An improper handling of continuation-level jumps in 'file_check_mem' function in 'funcs.c' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: phpMyAdmin < 4.9.6, 5.x < 5.0.3 Multiple Vulnerabilities (PMASA-2020-5, PMASA-2020-6) - Linux

Summary
phpMyAdmin is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.5.2.2
Fixed version:     4.9.6
Installation
path / port:       /phpmyadmin
```

Impact
Successful exploitation would allow an attacker to:
- If an attacker sends a crafted link to the victim with the malicious JavaScript, when the victim clicks on the link, the JavaScript will run and complete the instructions made by the attacker (CVE-2020-26934)
- An attacker could use this flaw to inject malicious SQL in to a query (CVE-2020-26935)

Solution:
Solution type: VendorFix
Update to version 4.9.6, 5.0.3 or later.

Affected Software/OS
phpMyAdmin prior to version 4.9.6 and 5.x prior to 5.0.3.

Vulnerability Insight
The following vulnerabilities exist:
- XSS relating to the transformation feature (CVE-2020-26934)
- SQL injection vulnerability in SearchController (CVE-2020-26935)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `phpMyAdmin < 4.9.6, 5.x < 5.0.3 Multiple Vulnerabilities (PMASA-2020-5, PMASA-2.`

NVT: PHP < 7.0.12 RCE / DoS Vulnerability - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a remote code execution (RCE) or denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     7.0.12
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 7.0.12 or later.

Affected Software/OS

PHP versions prior to 7.0.12.

Vulnerability Insight

The SplObjectStorage unserialize implementation in ext/spl/spl_observer.c does not verify that a key is an object, which allows remote attackers to execute arbitrary code or cause a denial of service (uninitialized memory access) via crafted serialized data.

Vulnerability Detection Method

. . . continues on next page . . .

. . . continued from previous page . . .

Checks if a vulnerable version is present on the target host.

Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to multiple denial of service (DoS) vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 5.5.9
Fixed version: None
Installation
path / port: 80/tcp

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
PHP versions through 7.1.5.

Vulnerability Insight
The following flaws exist:
- CVE-2017-8923: The zend_string_extend function in Zend/zend_string.h does not prevent changes to string objects that result in a negative length, which allows remote attackers to cause a denial of service (application crash) or possibly have unspecified other impact by leveraging a script's use of .= with a long string.
- CVE-2017-9119: The i_zval_ptr_dtor function in Zend/zend_variables.h allows attackers to cause a denial of service (memory consumption and application crash) or possibly have unspecified other impact by triggering crafted operations on array data structures.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP <= 7.1.5 Multiple DoS Vulnerabilities`

```

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.54
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.54 or later.

Affected Software/OS
Apache HTTP Server version 2.4.53 and prior.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2022-26377: mod_proxy_ajp: Possible request smuggling
- CVE-2022-28614: Read beyond bounds via ap_rwrite()
- CVE-2022-28615: Read beyond bounds in ap_strcmp_match()
- CVE-2022-29404: Denial of service in mod_lua r:parsebody
- CVE-2022-30556: Information disclosure in mod_lua with websockets
- CVE-2022-31813: mod_proxy X-Forwarded-For dropped by hop-by-hop mechanism

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

. . . continued from previous page . . .

path / port: 80/tcp

Impact
Successfully exploiting these issues allow remote attackers to execute arbitrary code in the context of the PHP process. Failed exploit attempts will likely crash the webserver.

Solution:
Solution type: VendorFix
Update to version 5.4.43, 5.5.27, 5.6.11 or later.

Affected Software/OS
PHP prior to version 5.4.43, 5.5.x prior to 5.5.27 and 5.6.x prior to 5.6.11 on Linux.

Vulnerability Insight
The following flaws exist:
- Inadequate boundary checks on user-supplied input by 'phar_fix_filepath' function in 'ext/phar/phar.c' script.
- Improper validation of file pointer in the 'phar_convert_to_other' function in 'ext/phar/phar_object.c' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: PHP < 5.4.43, 5.5.x < 5.5.27, 5.6.x < 5.6.11 Multiple Vulnerabilities (Mar 2016. ↪..

NVT: PHP < 5.6.31, 7.0.x < 7.0.21, 7.1.x < 7.1.7 Multiple Vulnerabilities (Jul 2017) - Linux

Product detection result

cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

Installed version: 5.5.9

. . . continues on next page . . .

. . . continued from previous page . . .

```
Fixed version:      5.6.31
Installation
path / port:        80/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to leak information from the interpreter, crash PHP interpreter and also disclose sensitive information.

Solution:
Solution type: VendorFix
Update to version 5.6.31, 7.0.21, 7.1.7 or later.

Affected Software/OS
PHP prior to version 5.6.31, 7.0.x prior to 7.0.21 and 7.1.x prior to 7.1.7.

Vulnerability Insight
The following vulnerabilities exist:
- An ext/date/lib/parse_date.c out-of-bounds read affecting the php_parse_date function.
- The openssl extension PEM sealing code did not check the return value of the OpenSSL sealing function.
- lack of bounds checks in the date extension's timelib_meridian parsing code.
- A stack-based buffer overflow in the zend_ini_do_op() function in the 'Zend/zend_ini_parser.c' script.
- The GIF decoding function gdImageCreateFromGifCtx in gd_gif_in.c in the GD Graphics Library (aka libgd) does not zero colorMap arrays before use.
- Heap buffer overread (READ: 1) finish_nested_data from unserialize
- oniguruma upstream fix

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.31, 7.0.x < 7.0.21, 7.1.x < 7.1.7 Multiple Vulnerabilities (Jul 2017).`

Critical (CVSS: 9.8)
NVT: PHP 'CVE-2019-13224' Use-After-Free Vulnerability - Linux

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to a use-after-free vulnerability in a used third-pary library.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     7.1.32
Installation
path / port:       80/tcp
```

Impact
This flaw allows attackers to potentially cause information disclosure, denial of service, or possibly code execution by providing a crafted regular expression.

Solution:
Solution type: VendorFix
Update to version 7.1.32, 7.3.9 or later.

Affected Software/OS
PHP version before 7.1.32 and 7.3.x before 7.3.9.

Vulnerability Insight
The flaw exists due to a use-after-free in onig_new_deluxe() in regext.c of the third-party library Oniguruma 6.9.2 which is used by PHP.
The attacker provides a pair of a regex pattern and a string, with a multi-byte encoding that gets handled by onig_new_deluxe().

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP 'CVE-2019-13224' Use-After-Free Vulnerability - Linux`

NVT: Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a HTTP request smuggling vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.56
Installation
path / port:       80/tcp
```

Impact

Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

Solution:

Solution type: VendorFix

Update to version 2.4.56 or later.

Affected Software/OS

Apache HTTP Server versions 2.4.0 through 2.4.55.

Vulnerability Insight

Some mod_proxy configurations allow a HTTP Request Smuggling attack.

. . . continues on next page . . .

. . . continued from previous page . . .

Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     8.1.32
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.1.32, 8.2.28 or later.

Affected Software/OS
PHP versions prior to 8.1.32, and 8.2.x prior to 8.2.28.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2025-1217: Header parser of 'http' stream wrapper does not handle folded headers
- CVE-2025-1219: libxml streams use wrong 'content-type' header when requesting a redirected resource
- CVE-2025-1734: Streams HTTP wrapper does not fail for headers without colon
- CVE-2025-1736: Stream HTTP wrapper header check might omit basic auth header
- CVE-2025-1861: Stream HTTP wrapper truncate redirect location to 1024 bytes

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 8.1.32, 8.2.x < 8.2.28 Multiple Vulnerabilities - Linux`

NVT: PHP < 5.6.25, 7.x < 7.0.10 Multiple Vulnerabilities (Sep 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.25
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to cause a denial of service, to obtain sensitive information from process memory, to inject arbitrary-type session data by leveraging control of a session name.

Solution:

Solution type: VendorFix

Update to version 5.6.25, 7.0.10 or later.

Affected Software/OS

PHP prior to version 5.6.25 and 7.x prior to 7.0.10 on Linux.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

The following flaws exist:
- Invalid wddxPacket XML document that is mishandled in a wddx_deserialize call in 'ext/wddx/wddx.c' script.
- Error in 'php_wddx_pop_element' function in 'ext/wddx/wddx.c' script.
- An error in 'php_wddx_process_data' function in 'ext/wddx/wddx.c' script.
- Improper handling of the case of a thumbnail offset that exceeds the file size in 'exif_process_IFD_in_TIFF' function in 'ext/exif/exif.c' script.
- Improper validation of gamma values in 'imagegammacorrect' function in 'ext/gd/gd.c' script.
- Improper validation of number of colors in 'imagegammacorrect' function in 'ext/gd/gd.c' script.
- The script 'ext/session/session.c' skips invalid session names in a way that triggers incorrect parsing.
- Improper handling of certain objects in 'ext/standard/var_unserializer.c' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     None
Installation
path / port:       80/tcp
```

Solution:

Solution type: WillNotFix

No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS

PHP versions through 5.6.27 and 7.0.x through 7.0.12.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

PHP mishandles property modification during __wakeup processing, which allows remote attackers to cause a denial of service or possibly have unspecified other impact via crafted serialized data, as demonstrated by Exception::__toString with DateInterval::__wakeup.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP <= 5.6.27 / 7.0.x <= 7.0.12 DoS Vulnerability`

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to an XML external entity (XXE) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 5.5.9
Fixed version:     5.5.22
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting this issue allow remote attackers to conduct XML External Entity (XXE) and XML Entity Expansion (XEE) attacks.

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to PHP version 5.5.22, 5.6.6 or later.

Affected Software/OS
PHP prior to version 5.5.22 and 5.6.x prior to 5.6.6 on Linux.

Vulnerability Insight
The flaw is due to script 'ext/libxml/libxml.c' does not isolate each thread from 'libxml_disable_entity_loader' when PHP-FPM is used.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.22, 5.6.x < 5.6.6 XXE Vulnerability - Linux`

cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.27
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow remote attackers to cause the target service to crash. A remote user can obtain potentially sensitive information as well on the target system.

Solution:
Solution type: VendorFix
Update to Apache HTTP Server 2.2.34 or 2.4.27 or later.

Affected Software/OS
Apache HTTP Server 2.2.x before 2.2.34 and 2.4.x before 2.4.27.

Vulnerability Insight
The flaw exists due to error in Apache 'mod_auth_digest' which does not properly initialize memory used to process 'Digest' type HTTP Authorization headers.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux

NVT: PHP < 5.5.31, 5.6.x < 5.6.17, 7.x < 7.0.2 Out of Bounds Read Memory Corruption Vulnerability (Mar 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to an out-of-bounds read memory corruption vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.31
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to obtain sensitive information or cause a denial-of-service condition.

Solution:

Solution type: VendorFix

Update to version 5.5.31, 5.6.17, 7.0.2 or later.

Affected Software/OS

PHP prior to version 5.5.31, 5.6.x prior to 5.6.17 and 7.x prior to 7.0.2 on Linux.

Vulnerability Insight

A memory corruption vulnerability occurs via a large 'bgd_color' argument to the 'imagerotate' function in 'ext/gd/libgd/gd_interpolation.c' script.

Vulnerability Detection Method

. . . continues on next page . . .

. . . continued from previous page . . .

Checks if a vulnerable version is present on the target host.

Product detection result
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 5.5.9
Fixed version: 5.5.31
Installation
path / port: 80/tcp

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

Successfully exploiting this issue allow attackers to obtain sensitive information from process memory or cause a denial of service (out-of-bounds read and buffer overflow) via a long string.

Solution:
Solution type: VendorFix
Update to version 5.5.31, 5.6.17, 7.0.2 or later.

Affected Software/OS
PHP prior to version 5.5.31, 5.6.x prior to 5.6.17 and 7.x prior to 7.0.2 on Linux.

Vulnerability Insight
The flaw is due to the 'sapi/fpm/fpm/fpm_log.c' script misinterprets the semantics of the snprintf return value.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.31, 5.6.x < 5.6.17, 7.x < 7.0.2 DoS Vulnerability (Aug 2016) - Linux`

2.33.3 High 80/tcp

High (CVSS: 8.8)
NVT: phpMyAdmin <= 5.1.1 CSV Injection Vulnerability - Linux

Summary
phpMyAdmin is prone to a CSV injection vulnerability via Export Section.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.5.2.2
Fixed version:     None
Installation
path / port:       /phpmyadmin
```

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
phpMyAdmin version 5.1.1 and prior.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

NOTE: the vendor disputes this because 'the CSV file is accurately generated based on the database contents.'
Nevertheless the vendor could implement measures while doing the CSV export which could lower or mitigate the risk originating from this flaw.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `phpMyAdmin <= 5.1.1 CSV Injection Vulnerability - Linux`

High (CVSS: 8.8)
NVT: phpMyAdmin < 4.9.4, 5.x < 5.0.1 SQL Injection Vulnerability (PMASA-2020-1) - Linux

Summary
phpMyAdmin is prone to an SQL injection vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.5.2.2
Fixed version:     4.9.4
Installation
path / port:       /phpmyadmin
```

Impact
A malicious user could inject custom SQL in place of their own username when creating queries to this page. An attacker must have a valid MySQL account to access the server.

Solution:
Solution type: VendorFix
Update to version 4.9.4, 5.0.1 or later.

Affected Software/OS
phpMyAdmin prior to version 4.9.4 and 5.x prior to 5.0.1.

Vulnerability Insight
An SQL injection flaw has been discovered in the user accounts page.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `phpMyAdmin < 4.9.4, 5.x < 5.0.1 SQL Injection Vulnerability (PMASA-2020-1) - Li.`

NVT: PHP < 5.6.36, 7.x < 7.0.30, 7.1.x < 7.1.17, 7.2.x < 7.2.5 Multiple Vulnerabilities (May 2018) - Linux

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 5.5.9
Fixed version:     5.6.36
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow an attacker to conduct XSS attacks, crash PHP, conduct denial of service condition and execute arbitrary code in the context of the affected application.

Solution:
Solution type: VendorFix
Update to version 5.6.36, 7.0.30, 7.1.17, 7.2.5 or later.

Affected Software/OS
PHP prior to version 5.6.36, 7.0.x prior to 7.0.30, 7.1.x prior to 7.1.17 and 7.2.x prior to 7.2.5 on Linux.

Vulnerability Insight
The following flaws exist:
- CVE-2018-10549: Out of bounds read error in 'exif_read_data' function while processing crafted JPG data.
- CVE-2018-10546: An error in stream filter 'convert.iconv' which leads to infinite loop on invalid sequence.
- CVE-2018-10548: An error in the LDAP module of PHP which allows a malicious LDAP server or man-in-the-middle attacker to crash PHP.
- CVE-2018-10547: An error in the 'phar_do_404()' function in 'ext/phar/phar_object.c' script which returns parts of the request unfiltered, leading to another XSS vector. This is due to incomplete fix for CVE-2018-5712.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.36, 7.x < 7.0.30, 7.1.x < 7.1.17, 7.2.x < 7.2.5 Multiple Vulnerabilit.`

NVT: PHP < 5.6.18, 7.x < 7.0.3 DoS Vulnerability (Jul 2016) - Linux

Product detection result
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 5.5.9
Fixed version: 5.6.18
Installation
path / port: 80/tcp

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

Successfully exploiting this issue allow remote attackers to cause a denial of service (heap memory corruption) or possibly have unspecified other impact.

Solution:
Solution type: VendorFix
Update to version 5.6.18, 7.0.3 or later.

Affected Software/OS
PHP prior to version 5.6.18 and 7.x prior to 7.0.3 on Linux.

Vulnerability Insight
The flaw is due an improper handling of zero-size '././@LongLink' files by 'phar_make_dirstream' function in ext/phar/dirstream.c script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.18, 7.x < 7.0.3 DoS Vulnerability (Jul 2016) - Linux`

Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP released new versions which include a security fix.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     7.4.30
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 7.4.30, 8.0.20, 8.1.7 or later.

Affected Software/OS
PHP prior to version 7.4.30, 8.0.x through 8.0.19 and 8.1.x through 8.1.6.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2022-31625: Uninitialized array in pg_query_params()
- CVE-2022-31626: mysqlnd/pdo password buffer overflow

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: PHP < 5.5.36, 5.6.x < 5.6.22 Multiple Vulnerabilities (Aug 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.36
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to cause a denial of service or possibly have unspecified other impact.

Solution:

Solution type: VendorFix

Update to version 5.5.36, 5.6.22 or later.

Affected Software/OS

. . . continues on next page . . .

. . . continued from previous page . . .

PHP prior to version 5.5.36 and 5.6.x prior to 5.6.22 on Linux.

Vulnerability Insight
The following flaws exist:
- Integer overflow in the fread function in 'ext/standard/file.c' script.
- Integer overflow in the php_html_entities function in 'ext/standard/html.c' script.
- An Integer overflow in the php_escape_html_entities_ex function in 'ext/standard/html.c' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.36
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to cause a denial of service (out-of-bounds read) or possibly have unspecified other impact.

Solution:
Solution type: VendorFix
Update to version 5.5.36, 5.6.22, 7.0.7 or later.

Affected Software/OS
PHP prior to version 5.5.36, 5.6.x prior to 5.6.22 and 7.x prior to 7.0.7 on Linux.

Vulnerability Insight
The following flaws exist:
- The 'get_icu_value_internal' function in 'ext/intl/locale/locale_methods.c' script does not ensure the presence of a '\0' character.
- The 'gd_interpolation.c' script in the GD Graphics Library mishandled by the imagescale function.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.36, 5.6.x < 5.6.22, 7.x < 7.0.7 Multiple Vulnerabilities (Aug 2016) -. ↪..`

Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

. . . continues on next page . . .

. . . continued from previous page . . .

```
Installed version: 2.4.7
Fixed version:     2.4.52
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.52 or later.

Affected Software/OS
Apache HTTP Server version 2.4.7 through 2.4.51.

Vulnerability Insight
A crafted URI sent to httpd configured as a forward proxy (ProxyRequests on) can cause a crash (NULL pointer dereference) or, for configurations mixing forward and reverse proxy declarations, can allow for requests to be directed to a declared Unix Domain Socket endpoint (Server Side Request Forgery).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 2.4.7 - 2.4.51 Multiple Vulnerabilities - Linux`

```
Installed version: 5.5.47
Fixed version:     See reference
Installation
path / port:       3306/tcp
```

Impact
Successful exploitation will allow remote attackers to have an impact on confidentiality, integrity and availability.

Solution:
Solution type: VendorFix
The vendor has released updates. Please see the references for more information.

Affected Software/OS
Oracle MySQL version 5.5.x through 5.5.61, 5.6.x through 5.6.41, 5.7.x through 5.7.23 and 8.0.x through 8.0.12.

Vulnerability Insight
Multiple flaws exist due to:
- An unspecified error within 'InnoDB (zlib)' component of MySQL Server.
- An unspecified error within 'Server: Parser' component of MySQL Server.
- An unspecified error within 'Client programs' component of MySQL Server.
- An unspecified error within 'Server: Storage Engines' component of MySQL Server.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Oracle Mysql Security Update (cpuoct2018 - 02) - Linux`
OID:1.3.6.1.4.1.25623.1.0.814259
Version used: `2025-09-09T05:38:49Z`

Product Detection Result
Product: `cpe:/a:mysql:mysql:5.5.47-`
Method: `MariaDB / Oracle MySQL Detection (MySQL Protocol)`
OID: 1.3.6.1.4.1.25623.1.0.100152)

```

Summary

Oracle MySQL Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.47
Fixed version:     See the referenced vendor advisory
Installation
path / port:       3306/tcp
```

Impact

Successful exploitation of this vulnerability will allow a remote user to access restricted data.

Solution:

Solution type: VendorFix

Updates are available. Please see the references for more information.

Affected Software/OS

Oracle MySQL Server versions 5.5.52 and prior, 5.6 through 5.6.33 and 5.7 through 5.7.15.

Vulnerability Insight

Multiple flaws exist due to multiple unspecified errors in the 'Server: Security: Encryption' and 'Server: Logging' components.

[return to 172.30.9.2]

2.34.2 Critical 80/tcp

Critical (CVSS: 10.0)
NVT: PHP End of Life (EOL) Detection - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

The PHP version on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

. . . continues on next page . . .

. . . continued from previous page . . .

```
The "PHP" version on the remote host has reached the end of life.
CPE:                cpe:/a:php:php:5.5.9
Installed version: 5.5.9
EOL version:        5.5
EOL date:           2016-07-21
```

Impact
An EOL version of PHP is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: VendorFix
Update the PHP version on the remote host to a still supported version.

Vulnerability Insight
Each release branch of PHP is fully supported for two years from its initial stable release. During this period, bugs and security issues that have been reported are fixed and are released in regular point releases.
After this two year period of active support, each branch is then supported for an additional year for critical security issues only. Releases during this period are made on an as-needed basis: there may be multiple point releases, or none, depending on the number of reports.
Once the three years of support are completed, the branch reaches its end of life and is no longer supported.

Vulnerability Detection Method
Checks if an EOL version is present on the target host.
Details: `PHP End of Life (EOL) Detection - Linux`
OID:1.3.6.1.4.1.25623.1.0.105889
Version used: `2025-09-24T05:39:03Z`

`cpe:/a:php:php:5.5.9`

. . . continues on next page . . .

. . . continued from previous page . . .

Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.26
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to cause a denial of service, to read or write to arbitrary files, also execute arbitrary code via a long reply to a LIST command, leading to a heap-based buffer overflow.

Solution:
Solution type: VendorFix
Update to version 5.4.42, 5.5.26, 5.6.10 or later.

Affected Software/OS
PHP prior to version 5.4.42, 5.5.x prior to 5.5.26 and 5.6.x prior to 5.6.10 on Linux.

Vulnerability Insight
The following flaws exist:
- Improper validation of token extraction for table names, in the php_pgsql_meta_data function in pgsql.c in the PostgreSQL extension.
- Integer overflow in the ftp_genlist function in ext/ftp/ftp.c
- PHP does not ensure that pathnames lack %00 sequences.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: PHP < 5.4.42, 5.5.x < 5.5.26, 5.6.x < 5.6.10 Multiple Vulnerabilities (Aug 2016. ↪..

Critical (CVSS: 9.8)
NVT: Apache HTTP Server Multiple Vulnerabilities (Jun 2017) - Linux

Product detection result
`cpe:/a:apache:http_server:2.4.7`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.26
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow remote attackers to bypass authentication and perform unauthorized actions, cause a denial-of-service condition and gain access to potentially sensitive information.

Solution:
Solution type: VendorFix
Update to Apache HTTP Server 2.2.33 or 2.4.26 or later.

Affected Software/OS
Apache HTTP Server 2.2.x before 2.2.33 and 2.4.x before 2.4.26.

Vulnerability Insight
Multiple flaws exist as,
- The mod_mime can read one byte past the end of a buffer when sending a malicious Content-Type response header.
- The mod_ssl may dereference a NULL pointer when third-party modules call ap_hook_process_connection() during an HTTP request to an HTTPS port.
- An use of the ap_get_basic_auth_pw() by third-party modules outside of the authentication phase may lead to authentication requirements being bypassed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: PHP < 7.1.33, 7.2.x < 7.2.24, 7.3.x < 7.3.11 RCE Vulnerability - Version Check

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to a remote code execution (RCE) vulnerability in certain nginx + php-fpm configurations.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     7.1.33
Installation
path / port:       80/tcp
```

Impact
Successful exploitation would allow an unauthenticated remote attacker to execute arbitrary code on the target machine.

Solution:
Solution type: VendorFix
Update to version 7.1.33, 7.2.24, 7.3.11 or later.
As an alternative a workaround to update the nginx configuration to mitigate this vulnerability is described at the PHP.net bugtracker linked in the references.

Affected Software/OS
PHP prior to version 7.1.33, 7.2.x prior to 7.2.24 and 7.3.x prior to 7.3.11.

Vulnerability Insight
The file sapi/fpm/fpm/fpm_main.c contains pointer arithmetic that assumes that env_path_info has a prefix equal to the path to the php script. However, the code does not check this assumption is satisfied. The absence of the check can lead to an invalid pointer in the 'path_info' variable.
Such conditions can be achieved in a pretty standard Nginx configuration. The regexp in 'fastcgi_split_path_info' directive can be broken using the newline character (in encoded form, %0a). Broken regexp leads to empty PATH_INFO, which triggers the bug.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 7.1.33, 7.2.x < 7.2.24, 7.3.x < 7.3.11 RCE Vulnerability - Version Check`

path / port: 80/tcp

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

Successfully exploiting this issue allow remote attackers to execute arbitrary code by triggering a failed SplMinHeap::compare operation.

Solution:
Solution type: VendorFix
Update to version 5.5.27, 5.6.11 or later.

Affected Software/OS
PHP prior to version 5.5.27 and 5.6.x prior to 5.6.11 on Linux.

Vulnerability Insight
An use-after-free vulnerability occurs in the 'spl_ptr_heap_insert' function in 'ext/spl/spl_heap.c'.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.27, 5.6.x < 5.6.11 Arbitrary Code Execution Vulnerability (Aug 2016) .`

. . . continues on next page . . .

. . . continued from previous page . . .

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.37
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to cause a denial of service (use-after-free and application crash) or possibly execute arbitrary code or possibly have unspecified other impact via a large integer argument.

Solution:
Solution type: VendorFix
Update to version 5.5.37, 5.6.23 or later.

Affected Software/OS
PHP prior to version 5.5.37 and 5.6.x prior to 5.6.23 on Linux.

Vulnerability Insight
The following flaws exist:
- The 'spl_array.c' in the SPL extension improperly interacts with the unserialize implementation and garbage collection.
- Integer overflow in the 'SplFileObject::fread' function in 'spl_directory.c' in the SPL extension.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Update to version 5.3.29, 5.4.30, 5.5.14 or later.

Affected Software/OS
PHP versions 5.3.x prior to 5.3.29, 5.4.x prior to 5.4.30 and 5.5.x prior to 5.5.14.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2014-3981: Insecure temporary file use in the configure script
- CVE-2014-4721: phpinfo() Type Confusion Information Leak Vulnerability
- CVE-2014-0207: cdf_read_short_sector insufficient boundary check
- CVE-2014-3478: mconvert incorrect handling of truncated pascal string size
- CVE-2014-3479: cdf_check_stream_offset insufficient boundary check
- CVE-2014-3480: cdf_count_chain insufficient boundary check
- CVE-2014-3487: cdf_read_property_info insufficient boundary check
- CVE-2014-4049: Fix potential segfault in dns_get_record()
- CVE-2014-3515: unserialize() SPL ArrayObject / SPLObjectStorage Type Confusion
- CVE-2014-9912: Buffer overflow in locale_get_display_name and uloc_getDisplayName (libicu 4.8.1)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.3.29, 5.4.x < 5.4.30, 5.5.x < 5.5.14 Multiple Vulnerabilities (Jun/Aug .`

Critical (CVSS: 9.8)
NVT: PHP < 5.5.35, 5.6.x < 5.6.21, 7.x < 7.0.6 Multiple Vulnerabilities (Jul 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.35
Installation
path / port:       80/tcp
```

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

Successfully exploiting these issues allow remote attackers to cause a denial of service (out-of-bounds read) or possibly have unspecified other impact.

Solution:
Solution type: VendorFix
Update to version 5.5.35, 5.6.21, 7.0.6 or later.

Affected Software/OS
PHP prior to version 5.5.35, 5.6.x prior to 5.6.21 and 7.x prior to 7.0.6 on Linux.

Vulnerability Insight
The following flaws exist:
- Improper validation of TIFF start data in 'exif_process_TIFF_in_JPEG' function in 'ext/exif/exif.c' script.
- Improper validation of IFD sizes in 'exif_process_TIFF_in_JPEG' function in 'ext/exif/exif.c' script.
- Improper construction of spprintf arguments, in 'exif_process_TIFF_in_JPEG' function in 'ext/exif/exif.c' script.
- Error in 'grapheme_strpos function' in 'ext/intl/grapheme/grapheme_string.c'.
- Error in 'xml_parse_into_struct' function in 'ext/xml/xml.c' script.
- The 'bcpowmod' function in 'ext/bcmath/bcmath.c' improperly modifies certain data structures.
- Improper validation of input passed to 'bcpowmod' function in 'ext/bcmath/bcmath.c' script.
- Error in 'grapheme_strpos' function in ext/intl/grapheme/grapheme_string.c script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.34
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to cause a denial of service (buffer overflow and application crash) or possibly execute arbitrary code.

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to version 5.5.34, 5.6.20, 7.0.5 or later.

Affected Software/OS
PHP prior to version 5.5.34, 5.6.x prior to 5.6.20 and 7.0.x prior to 7.0.5 on Linux.

Vulnerability Insight
The following flaws exist:
- Multiple integer overflows in the mbfl_strcut function in 'ext/mbstring/libmbfl/mbfl/mbfilter.c' script.
- Format string vulnerability in the php_snmp_error function in 'ext/snmp/snmp.c' script.
- An improper handling of '\0' characters by the 'phar_analyze_path' function in 'ext/phar/phar.c' script.
- An integer overflow in the 'php_raw_url_encode' function in 'ext/standard/url.c' script.
- An improper handling of continuation-level jumps in 'file_check_mem' function in 'funcs.c' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: PHP < 5.6.7 DoS Vulnerability - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.7
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to cause a denial of service.

Solution:

Solution type: VendorFix

. . . continues on next page . . .

. . . continued from previous page . . .

Update to version 5.6.7 or later.

Affected Software/OS
PHP prior to version 5.6.7 on Linux.

Vulnerability Insight
The flaw is due to 'type confusion' issues in 'ext/soap/php_encoding.c', 'ext/soap/php_http.c', and 'ext/soap/soap.c' scripts.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.7 DoS Vulnerability - Linux`
OID:1.3.6.1.4.1.25623.1.0.808673
Version used: `2025-09-24T05:39:03Z`

Product Detection Result
Product: `cpe:/a:php:php:5.5.9`
Method: `PHP Detection Consolidation`
OID: 1.3.6.1.4.1.25623.1.0.171722)

NVT: PHP 5.x < 5.6.34, 7.x < 7.0.28, 7.1.x < 7.1.15, 7.2.x < 7.2.3 Stack Buffer Overflow Vulnerability (Mar 2018) - Linux

Product detection result

. . . continues on next page . . .

. . . continued from previous page . . .

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary
PHP is prone to a stack buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.34
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow an attacker to execute arbitrary code in the context of the affected application. Failed exploit attempts will result in denial-of-service conditions.

Solution:
Solution type: VendorFix
Update to version 5.6.34, 7.0.28, 7.1.15, 7.2.3 or later.

Affected Software/OS
PHP versions 5.x prior to 5.6.34, 7.x prior to 7.0.28, 7.1.x prior to 7.1.15 and 7.2.x prior to 7.2.3 on Linux.

Vulnerability Insight
The flaw exists because php fails to adequately bounds-check user-supplied data before copying it into an insufficiently sized buffer.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP 5.x < 5.6.34, 7.x < 7.0.28, 7.1.x < 7.1.15, 7.2.x < 7.2.3 Stack Buffer Over.`

NVT: PHP < 5.6.26, 7.x < 7.0.11 Multiple Vulnerabilities (Sep 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.26
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to cause a denial of service, or possibly have unspecified other impact.

Solution:

Solution type: VendorFix

Update to version 5.6.26, 7.0.11 or later.

Affected Software/OS

PHP prior to version 5.6.26 and 7.x prior to 7.0.11 on Linux.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
The following flaws exist:
- Use-after-free vulnerability in the 'wddx_stack_destroy' function in 'ext/wddx/wddx.c' script.
- Improper verification of a BIT field has the UNSIGNED_FLAG flag in 'ext/mysqlnd/mysqlnd_wireprotocol.c' script.
- The ZIP signature-verification feature does not ensure that the uncompressed_filesize field is large enough.
- The script 'ext/spl/spl_array.c' proceeds with SplArray unserialization without validating a return value and data type.
- The script 'ext/intl/msgformat/msgformat_format.c' does not properly restrict the locale length provided to the Locale class in the ICU library.
- An error in the php_wddx_push_element function in ext/wddx/wddx.c.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.26, 7.x < 7.0.11 Multiple Vulnerabilities (Sep 2016) - Linux`

NVT: PHP < 5.6.31, 7.0.x < 7.0.21, 7.1.x < 7.1.7 Multiple Vulnerabilities (Jul 2017) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.31
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to leak information from the interpreter, crash PHP interpreter and also disclose sensitive information.

Solution:

Solution type: VendorFix

Update to version 5.6.31, 7.0.21, 7.1.7 or later.

Affected Software/OS

PHP prior to version 5.6.31, 7.0.x prior to 7.0.21 and 7.1.x prior to 7.1.7.

Vulnerability Insight

The following vulnerabilities exist:

- An ext/date/lib/parse_date.c out-of-bounds read affecting the php_parse_date function.
- The openssl extension PEM sealing code did not check the return value of the OpenSSL sealing function.
- lack of bounds checks in the date extension's timelib_meridian parsing code.
- A stack-based buffer overflow in the zend_ini_do_op() function in the 'Zend/zend_ini_parser.c' script.

. . . continues on next page . . .

. . . continued from previous page . . .

- The GIF decoding function gdImageCreateFromGifCtx in gd_gif_in.c in the GD Graphics Library (aka libgd) does not zero colorMap arrays before use.
- Heap buffer overread (READ: 1) finish_nested_data from unserialize
- oniguruma upstream fix

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.31, 7.0.x < 7.0.21, 7.1.x < 7.1.7 Multiple Vulnerabilities (Jul 2017).`

Solution:

. . . continues on next page . . .

. . . continued from previous page . . .

Solution type: VendorFix
Update to version 5.6.29, 7.0.14 or later.

Affected Software/OS
PHP versions prior to 5.6.29 and 7.0.x prior to 7.0.14.

Vulnerability Insight
The php_wddx_push_element function in ext/wddx/wddx.c allows remote attackers to cause a denial of service (out-of-bounds read and memory corruption) or possibly have unspecified other impact via an empty boolean element in a wddxPacket XML document.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.29, 7.0.x < 7.0.14 DoS Vulnerability - Linux`

NVT: PHP < 5.5.37, 5.6.x < 5.6.23, 7.x < 7.0.8 Multiple Vulnerabilities (Aug 2016) - Linux

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.37
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to cause a denial of service (buffer overflow and application crash) or possibly execute arbitrary code.

Solution:
Solution type: VendorFix
Update to PHP version 5.5.37, 5.6.23, 7.0.8 or later.

Affected Software/OS
PHP prior to version 5.5.37, 5.6.x prior to 5.6.23 and 7.x prior to 7.0.8 on Linux.

Vulnerability Insight
The following flaws exist:
- The 'php_zip.c' script in the zip extension improperly interacts with the unserialize implementation and garbage collection.
- The php_wddx_process_data function in 'wddx.c' script in the WDDX extension mishandled data in a wddx_deserialize call.
- The multiple integer overflows in 'mcrypt.c' script in the mcrypt extension.
- The double free vulnerability in the '_php_mb_regex_ereg_replace_exec' function in 'php_mbregex.c' script in the mbstring extension.
- An integer overflow in the '_gd2GetHeader' function in 'gd_gd2.c' script in the GD Graphics Library.
- An integer overflow in the 'gdImageCreate' function in 'gd.c' script in the GD Graphics Library.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.37, 5.6.x < 5.6.23, 7.x < 7.0.8 Multiple Vulnerabilities (Aug 2016) -.`

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.28
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 5.6.28, 7.0.13 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
PHP prior to version 5.6.28 and 7.x prior to 7.0.13.

Vulnerability Insight
The following flaws exist:
- CVE-2016-8670: Stack Buffer Overflow in GD dynamicGetbuf
- CVE-2016-9933, CVE-2016-9934: Multiple denial of service (DoS) vulnerabilities
- CVE-2016-10397: Security bypass vulnerability

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.28, 7.x < 7.0.13 Multiple Vulnerabilities (Nov 2016) - Linux`

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.25
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to cause a denial of service, to obtain sensitive information from process memory, to inject arbitrary-type session data by leveraging control of a session name.

Solution:

Solution type: VendorFix

Update to version 5.6.25, 7.0.10 or later.

Affected Software/OS

PHP prior to version 5.6.25 and 7.x prior to 7.0.10 on Linux.

Vulnerability Insight

The following flaws exist:

- Invalid wddxPacket XML document that is mishandled in a wddx_deserialize call in 'ext/wddx/wddx.c' script.
- Error in 'php_wddx_pop_element' function in 'ext/wddx/wddx.c' script.
- An error in 'php_wddx_process_data' function in 'ext/wddx/wddx.c' script.
- Improper handling of the case of a thumbnail offset that exceeds the file size in 'exif_process_IFD_in_TIFF' function in 'ext/exif/exif.c' script.
- Improper validation of gamma values in 'imagegammacorrect' function in 'ext/gd/gd.c' script.
- Improper validation of number of colors in 'imagegammacorrect' function in 'ext/gd/gd.c' script.
- The script 'ext/session/session.c' skips invalid session names in a way that triggers incorrect parsing.
- Improper handling of certain objects in 'ext/standard/var_unserializer.c' script.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `PHP < 5.6.25, 7.x < 7.0.10 Multiple Vulnerabilities (Sep 2016) - Linux`

NVT: Apache HTTP Server Multiple Vulnerabilities (Apr 2018) - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.30
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
Installation
path / port:        80/tcp
```

Impact
Successful exploitation will allow an attacker to replay HTTP requests across servers without detection, influence the user content, upload a malicious file, crash the Apache HTTP Server and perform denial of service attack.

Solution:
Solution type: VendorFix
Update to version 2.4.30 or later. Please see the references for more information.

Affected Software/OS
Apache HTTP Server versions from 2.4.1 to 2.4.4, 2.4.6, 2.4.7, 2.4.9, 2.4.10, 2.4.12, 2.4.16 to 2.4.18, 2.4.20, 2.4.23, 2.4.25 to 2.4.29.

Vulnerability Insight
Multiple flaws exist due to:
- Apache HTTP Server fails to correctly generate the nonce sent to prevent reply attacks.
- Misconfigured mod_session variable, HTTP_SESSION.
- Apache HTTP Server fails to sanitize the expression specified in '<FilesMatch>'.
- An error in Apache HTTP Server 'mod_authnz_ldap' when configured with AuthLDAPCharsetConfig.
- Apache HTTP Server fails to sanitize against a specially crafted request.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server Multiple Vulnerabilities (Apr 2018) - Linux`

NVT: PHP < 5.4.44, 5.5.x < 5.5.28, 5.6.x < 5.6.12 Multiple Vulnerabilities (Jul 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.28
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to cause a denial of service (NULL pointer dereference and application crash) or trigger unintended method execution to defeat cryptographic protection mechanisms.

Solution:

Solution type: VendorFix

Update to version 5.4.44, 5.5.28, 5.6.12 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
PHP prior to version 5.4.44, 5.5.x prior to 5.5.28 and 5.6.x prior to 5.6.12 on Linux.

Vulnerability Insight
Multiple flaws exist due to:
- An improper validation of certain Exception objects in 'Zend/zend_exceptions.c' script.
- The 'openssl_random_pseudo_bytes' function in 'ext/openssl/openssl.c' incorrectly relies on the deprecated 'RAND_pseudo_bytes' function.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.24
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues allow remote attackers to cause a denial of service, to obtain sensitive information from process memory and to execute arbitrary code via crafted dimensions.

Solution:

Solution type: VendorFix

Update to version 5.4.40, 5.5.24, 5.6.8 or later.

Affected Software/OS

PHP prior to version 5.4.40, 5.5.x prior to 5.5.24 and 5.6.x prior to 5.6.8.

Vulnerability Insight

The following flaws exist:

. . . continues on next page . . .

. . . continued from previous page . . .

- Multiple stack-based buffer overflows in the 'phar_set_inode' function in phar_internal.h script in PHP.
- Vulnerabilities in 'phar_parse_metadata' and 'phar_parse_pharfile' functions in ext/phar/phar.c script in PHP.
- A NULL pointer dereference flaw in the 'build_tablename' function in 'ext/pgsql/pgsql.c' script that is triggered when handling NULL return values for 'token'

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.4.40, 5.5.x < 5.5.24, 5.6.x < 5.6.8 Multiple Vulnerabilities - Linux`

```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.48
Installation
path / port:       80/tcp
```

Impact

- CVE-2020-35452: A specially crafted Digest nonce can cause a stack overflow in mod_auth_digest.
- CVE-2021-26690: A specially crafted Cookie header handled by mod_session can cause a NULL pointer dereference and crash, leading to a possible Denial Of Service.
- CVE-2021-26691: A specially crafted SessionHeader sent by an origin server could cause a heap overflow.

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to version 2.4.48 or later.

Affected Software/OS
Apache HTTP Server versions 2.4.0 to 2.4.46 on Linux.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2020-35452: mod_auth_digest possible stack overflow by one null byte
- CVE-2021-26690: mod_session NULL pointer dereference
- CVE-2021-26691: mod_session response handling heap overflow

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.38
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting these issues may allow attackers to cause a denial of service obtain sensitive information from process memory, or possibly have unspecified other impact.

Solution:

Solution type: VendorFix

Update to version 5.5.38, 5.6.24, 7.0.9 or later.

Affected Software/OS

PHP prior to version 5.5.38, 5.6.x prior to 5.6.24 and 7.x prior to 7.0.9.

Vulnerability Insight

The following flaws exist:

- Integer overflow in the 'php_stream_zip_opener' function in 'ext/zip/zip_stream.c'
- Integer signedness error in the 'simplestring_addn' function in 'simplestring.c' in xmlrpc-epi
- 'ext/snmp/snmp.c' improperly interacts with the unserialize implementation and garbage collection

. . . continues on next page . . .

. . . continued from previous page . . .

- The 'locale_accept_from_http' function in 'ext/intl/locale/locale_methods.c' does not properly restrict calls to the ICU 'uloc_acceptLanguageFromHTTP' function
- Error in the 'exif_process_user_comment' function of 'ext/exif/exif.c'
- Error in the 'exif_process_IFD_in_MAKERNOTE' function of 'ext/exif/exif.c'
- 'ext/session/session.c' does not properly maintain a certain hash data structure
- Integer overflow in the 'virtual_file_ex' function of 'TSRM/tsrm_virtual_cwd.c'
- Error in the 'php_url_parse_ex' function of 'ext/standard/url.c'
- Integer overflow error within _gdContributionsAlloc()
- Inadequate error handling in bzread()

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `PHP < 5.5.38, 5.6.x < 5.6.24, 7.0.x < 7.0.9 Multiple Vulnerabilities (Jul 2016).`

Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.54
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.54 or later.

Affected Software/OS
Apache HTTP Server version 2.4.53 and prior.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2022-26377: mod_proxy_ajp: Possible request smuggling
- CVE-2022-28614: Read beyond bounds via ap_rwrite()
- CVE-2022-28615: Read beyond bounds in ap_strcmp_match()
- CVE-2022-29404: Denial of service in mod_lua r:parsebody
- CVE-2022-30556: Information disclosure in mod_lua with websockets
- CVE-2022-31813: mod_proxy X-Forwarded-For dropped by hop-by-hop mechanism

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: PHP Multiple Vulnerabilities (Feb 2019) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.40
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 5.6.40, 7.1.16, 7.2.14, 7.3.1 or later.

Affected Software/OS

PHP versions before 5.6.40, 7.x before 7.1.26, 7.2.x before 7.2.14 and 7.3.x before 7.3.1.

Vulnerability Insight

The following flaws exist:

. . . continues on next page . . .

. . . continued from previous page . . .

- Fixed bug #77269 (efree() on uninitialized Heap data in imagescale leads to use-after-free). (CVE-2016-10166)
- Fixed bug #77270 (imagecolormatch Out Of Bounds Write on Heap). (CVE-2019-6977)
- Fixed bug #77370 (Buffer overflow on mb regex functions - fetch_token). (CVE-2019-9023)
- Fixed bug #77371 (heap buffer overflow in mb regex functions - compile_string_node). (CVE-2019-9023)
- Fixed bug #77381 (heap buffer overflow in multibyte match_at). (CVE-2019-9023)
- Fixed bug #77382 (heap buffer overflow due to incorrect length in expand_case_fold_string). (CVE-2019-9023)
- Fixed bug #77385 (buffer overflow in fetch_token). (CVE-2019-9023)
- Fixed bug #77394 (Buffer overflow in multibyte case folding - unicode). (CVE-2019-9023)
- Fixed bug #77418 (Heap overflow in utf32be_mbc_to_code). (CVE-2019-9023)
- Fixed bug #77247 (heap buffer overflow in phar_detect_phar_fname_ext). (CVE-2019-9021)
- Fixed bug #77242 (heap out of bounds read in xmlrpc_decode()). (CVE-2019-9020)
- Fixed bug #77380 (Global out of bounds read in xmlrpc base64 code). (CVE-2019-9024)

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.29
Installation
path / port:       80/tcp
```

. . . continues on next page . . .

. . . continued from previous page . . .

Impact
Successfully exploiting these issues allow remote attackers to read arbitrary empty directories, also to cause a denial of service.

Solution:
Solution type: VendorFix
Update to version 5.4.45, 5.5.29, 5.6.13 or later.

Affected Software/OS
PHP prior to version 5.4.45, 5.5.x prior to 5.5.29 and 5.6.x prior to 5.6.13 on Linux.

Vulnerability Insight
The following flaws exist:
- Error in the 'ZipArchive::extractTo' function in 'ext/zip/php_zip.c' script.
- The xsl_ext_function_php function in ext/xsl/xsltprocessor.c when libxml2 is used, does not consider the possibility of a NULL valuePop return value before proceeding with a free operation after the principal argument loop.
- Improper handling of multiple php_var_unserialize calls
- Multiple use-after-free vulnerabilities

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.4.45, 5.5.x < 5.5.29, 5.6.x < 5.6.13 Multiple Vulnerabilities (Jul 2016. ↪..`

Critical (CVSS: 9.8)
NVT: Apache HTTP Server < 2.4.60 Multiple Vulnerabilities - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.60
Installation
path / port:       80/tcp
```

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to version 2.4.60 or later.

Affected Software/OS
Apache HTTP Server version 2.4.59 and prior.

Vulnerability Insight
The following flaws exist:
- CVE-2024-36387: Denial of Service (DoS) by Null pointer in websocket over HTTP/2
- CVE-2024-38473: Proxy encoding problem
- CVE-2024-38474: Weakness with encoded question marks in backreferences
- CVE-2024-38475: Weakness in mod_rewrite when first segment of substitution matches filesystem path
- CVE-2024-38476: May use exploitable/malicious backend application output to run local handlers via internal redirect
- CVE-2024-38477: Crash resulting in DoS in mod_proxy via a malicious request
- CVE-2024-39573: mod_rewrite proxy handler substitution

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: PHP < 7.0.12 RCE / DoS Vulnerability - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a remote code execution (RCE) or denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
Fixed version:      7.0.12
Installation
path / port:        80/tcp
```

Solution:
Solution type: VendorFix
Update to version 7.0.12 or later.

Affected Software/OS
PHP versions prior to 7.0.12.

Vulnerability Insight
The SplObjectStorage unserialize implementation in ext/spl/spl_observer.c does not verify that a key is an object, which allows remote attackers to execute arbitrary code or cause a denial of service (uninitialized memory access) via crafted serialized data.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 7.0.12 RCE / DoS Vulnerability - Linux`
OID:1.3.6.1.4.1.25623.1.0.117800

. . . continued from previous page . . .

Summary
PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     None
Installation
path / port:       80/tcp
```

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
PHP versions through 5.6.27 and 7.0.x through 7.0.12.

Vulnerability Insight
PHP mishandles property modification during __wakeup processing, which allows remote attackers to cause a denial of service or possibly have unspecified other impact via crafted serialized data, as demonstrated by Exception::__toString with DateInterval::__wakeup.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP <= 5.6.27 / 7.0.x <= 7.0.12 DoS Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.117802
Version used: `2025-09-24T05:39:03Z`

Product Detection Result
Product: `cpe:/a:php:php:5.5.9`
Method: `PHP Detection Consolidation`
OID: 1.3.6.1.4.1.25623.1.0.171722)

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.30
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 5.6.30, 7.0.15, 7.1.1 or later.

Affected Software/OS
PHP prior to version 5.6.30, 7.x prior to 7.0.15 and 7.1.x prior to 7.1.1.

Vulnerability Insight
The following flaws exist:
- CVE-2016-10161: Heap out of bounds read on unserialize in finish_nested_data()
- CVE-2016-10158: FPE when parsing a tag format
- CVE-2016-10168: Signed Integer Overflow gd_io.c
- CVE-2016-10167: DOS vulnerability in gdImageCreateFromGd2Ctx()
- CVE-2017-11147: Seg fault when loading hostile phar
- CVE-2016-10160: Memory corruption when loading hostile phar
- CVE-2016-10159: Crash while loading hostile phar archive

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux

Product detection result
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)

Summary
Apache HTTP Server is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

Installed version:	2.4.7
Fixed version:	2.4.52
Installation path / port:	80/tcp

Solution:
Solution type: VendorFix
Update to version 2.4.52 or later.

Affected Software/OS
Apache HTTP Server versions through 2.4.51.

Vulnerability Insight
A carefully crafted request body can cause a buffer overflow in the mod_lua multipart parser (r:parsebody() called from Lua scripts).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux
OID:1.3.6.1.4.1.25623.1.0.117856

. . . continues on next page . . .

. . . continued from previous page . . .

Product detection result
`cpe:/a:php:php:5.5.9`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.27
Installation
path / port:       80/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to execute arbitrary code in the context of the PHP process. Failed exploit attempts will likely crash the webserver.

Solution:
Solution type: VendorFix
Update to version 5.4.43, 5.5.27, 5.6.11 or later.

Affected Software/OS
PHP prior to version 5.4.43, 5.5.x prior to 5.5.27 and 5.6.x prior to 5.6.11 on Linux.

Vulnerability Insight
The following flaws exist:
- Inadequate boundary checks on user-supplied input by 'phar_fix_filepath' function in 'ext/phar/phar.c' script.
- Improper validation of file pointer in the 'phar_convert_to_other' function in 'ext/phar/phar_object.c' script.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.4.43, 5.5.x < 5.5.27, 5.6.x < 5.6.11 Multiple Vulnerabilities (Mar 2016. ↪..`

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
PHP versions through 7.1.5.

Vulnerability Insight
The following flaws exist:
- CVE-2017-8923: The zend_string_extend function in Zend/zend_string.h does not prevent changes to string objects that result in a negative length, which allows remote attackers to cause a denial of service (application crash) or possibly have unspecified other impact by leveraging a script's use of .= with a long string.
- CVE-2017-9119: The i_zval_ptr_dtor function in Zend/zend_variables.h allows attackers to cause a denial of service (memory consumption and application crash) or possibly have unspecified other impact by triggering crafted operations on array data structures.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Product detection result
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     8.1.29
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.1.29, 8.2.20, 8.3.8 or later.

Affected Software/OS
PHP prior to version 8.1.29, version 8.2.x through 8.2.19 and 8.3.x through 8.3.7.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2024-4577: Argument injection in PHP-CGI (bypass of CVE-2012-1823)
- CVE-2024-5458: Filter bypass in filter_var FILTER_VALIDATE_URL
- CVE-2024-5585: Bypass of CVE-2024-1874
Note: As of 06/2024 the CVEs CVE-2024-4577 and CVE-2024-5585 are known to be exploitable on Windows systems only.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a use-after-free vulnerability in a used third-pary library.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     7.1.32
Installation
path / port:       80/tcp
```

Impact

This flaw allows attackers to potentially cause information disclosure, denial of service, or possibly code execution by providing a crafted regular expression.

Solution:

Solution type: VendorFix

Update to version 7.1.32, 7.3.9 or later.

Affected Software/OS

PHP version before 7.1.32 and 7.3.x before 7.3.9.

Vulnerability Insight

The flaw exists due to a use-after-free in onig_new_deluxe() in regext.c of the third-party library Oniguruma 6.9.2 which is used by PHP.

The attacker provides a pair of a regex pattern and a string, with a multi-byte encoding that gets handled by onig_new_deluxe().

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `PHP 'CVE-2019-13224' Use-After-Free Vulnerability - Linux`

NVT: Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a HTTP request smuggling vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.56
Installation
path / port:       80/tcp
```

Impact

Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

Solution:
Solution type: VendorFix
Update to version 2.4.56 or later.

Affected Software/OS

Apache HTTP Server versions 2.4.0 through 2.4.55.

Vulnerability Insight

Some mod_proxy configurations allow a HTTP Request Smuggling attack.

. . . continues on next page . . .

. . . continued from previous page . . .

Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.6)
NVT: PHP < 5.5.22, 5.6.x < 5.6.6 XXE Vulnerability - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to an XML external entity (XXE) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.22
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to conduct XML External Entity (XXE) and XML Entity Expansion (XEE) attacks.

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to PHP version 5.5.22, 5.6.6 or later.

Affected Software/OS
PHP prior to version 5.5.22 and 5.6.x prior to 5.6.6 on Linux.

Vulnerability Insight
The flaw is due to script 'ext/libxml/libxml.c' does not isolate each thread from 'libxml_disable_entity_loader' when PHP-FPM is used.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.5.22, 5.6.x < 5.6.6 XXE Vulnerability - Linux`

. . . continues on next page . . .

. . . continued from previous page . . .

Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 5.5.9
Fixed version: 7.2.27
Installation
path / port: 80/tcp

Solution:
Solution type: VendorFix
Update to version 7.2.27, 7.3.14, 7.4.2 or later.

Affected Software/OS
PHP versions before 7.2.27, 7.3.x and 7.4.x.

Vulnerability Insight
PHP is prone to multiple vulnerabilities:
- OOB read in php_strip_tags_ex (CVE-2020-7059)
- Global buffer-overflow in 'mbfl_filt_conv_big5_wchar' (CVE-2020-7060)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: PHP < 7.2.27, 7.3.x < 7.3.14, 7.4.x < 7.4.2 Multiple Vulnerabilities (Jan 2020).

NVT: Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.7
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.7
Fixed version:     2.4.27
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow remote attackers to cause the target service to crash. A remote user can obtain potentially sensitive information as well on the target system.

Solution:

Solution type: VendorFix

Update to Apache HTTP Server 2.2.34 or 2.4.27 or later.

Affected Software/OS

Apache HTTP Server 2.2.x before 2.2.34 and 2.4.x before 2.4.27.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
The flaw exists due to error in Apache 'mod_auth_digest' which does not properly initialize memory used to process 'Digest' type HTTP Authorization headers.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux`

NVT: PHP < 5.5.31, 5.6.x < 5.6.17, 7.x < 7.0.2 Out of Bounds Read Memory Corruption Vulnerability (Mar 2016) - Linux

Product detection result

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to an out-of-bounds read memory corruption vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.5.31
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to obtain sensitive information or cause a denial-of-service condition.

Solution:

Solution type: VendorFix

Update to version 5.5.31, 5.6.17, 7.0.2 or later.

Affected Software/OS

PHP prior to version 5.5.31, 5.6.x prior to 5.6.17 and 7.x prior to 7.0.2 on Linux.

Vulnerability Insight

A memory corruption vulnerability occurs via a large 'bgd_color' argument to the 'imagerotate' function in 'ext/gd/libgd/gd_interpolation.c' script.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

. . . continues on next page . . .

cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 5.5.9
Fixed version: 5.5.31
Installation
path / port: 80/tcp

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

Successfully exploiting this issue allow attackers to obtain sensitive information from process memory or cause a denial of service (out-of-bounds read and buffer overflow) via a long string.

Solution:
Solution type: VendorFix
Update to version 5.5.31, 5.6.17, 7.0.2 or later.

Affected Software/OS
PHP prior to version 5.5.31, 5.6.x prior to 5.6.17 and 7.x prior to 7.0.2 on Linux.

Vulnerability Insight
The flaw is due to the 'sapi/fpm/fpm/fpm_log.c' script misinterprets the semantics of the snprintf return value.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

```
cpe:/a:php:php:5.5.9
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.36
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow an attacker to conduct XSS attacks, crash PHP, conduct denial of service condition and execute arbitrary code in the context of the affected application.

Solution:

Solution type: VendorFix

Update to version 5.6.36, 7.0.30, 7.1.17, 7.2.5 or later.

Affected Software/OS

PHP prior to version 5.6.36, 7.0.x prior to 7.0.30, 7.1.x prior to 7.1.17 and 7.2.x prior to 7.2.5 on Linux.

Vulnerability Insight

The following flaws exist:

- CVE-2018-10549: Out of bounds read error in 'exif_read_data' function while processing crafted JPG data.

- CVE-2018-10546: An error in stream filter 'convert.iconv' which leads to infinite loop on invalid sequence.

- CVE-2018-10548: An error in the LDAP module of PHP which allows a malicious LDAP server or man-in-the-middle attacker to crash PHP.

. . . continues on next page . . .

. . . continued from previous page . . .

- CVE-2018-10547: An error in the 'phar_do_404()' function in 'ext/phar/phar_object.c' script which returns parts of the request unfiltered, leading to another XSS vector. This is due to incomplete fix for CVE-2018-5712.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.36, 7.x < 7.0.30, 7.1.x < 7.1.17, 7.2.x < 7.2.5 Multiple Vulnerabilit.`

Vulnerability Detection Result

```
Installed version: 5.5.9
Fixed version:     5.6.18
Installation
path / port:       80/tcp
```

Impact

Successfully exploiting this issue allow remote attackers to cause a denial of service (heap memory corruption) or possibly have unspecified other impact.

Solution:

Solution type: VendorFix

Update to version 5.6.18, 7.0.3 or later.

Affected Software/OS

PHP prior to version 5.6.18 and 7.x prior to 7.0.3 on Linux.

Vulnerability Insight

The flaw is due an improper handling of zero-size '././@LongLink' files by 'phar_make_dirstream' function in ext/phar/dirstream.c script.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `PHP < 5.6.18, 7.x < 7.0.3 DoS Vulnerability (Jul 2016) - Linux`

NVT: PHP End of Life (EOL) Detection - Linux

Product detection result

```
cpe:/a:php:php:7.0.17
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

The PHP version on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "PHP" version on the remote host has reached the end of life.
CPE:                cpe:/a:php:php:7.0.17
Installed version:  7.0.17
EOL version:        7.0
EOL date:           2019-01-10
```

Impact

An EOL version of PHP is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:

Solution type: VendorFix

Update the PHP version on the remote host to a still supported version.

Vulnerability Insight

Each release branch of PHP is fully supported for two years from its initial stable release. During this period, bugs and security issues that have been reported are fixed and are released in regular point releases.

After this two year period of active support, each branch is then supported for an additional year for critical security issues only. Releases during this period are made on an as-needed basis: there may be multiple point releases, or none, depending on the number of reports.

Once the three years of support are completed, the branch reaches its end of life and is no longer supported.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Method
Checks if an EOL version is present on the target host.
Details: `PHP End of Life (EOL) Detection - Linux`
OID:1.3.6.1.4.1.25623.1.0.105889

Critical (CVSS: 9.8)
NVT: PHP < 7.1.33, 7.2.x < 7.2.24, 7.3.x < 7.3.11 RCE Vulnerability - Version Check

Product detection result
`cpe:/a:php:php:7.0.17`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to a remote code execution (RCE) vulnerability in certain nginx + php-fpm configurations.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 7.0.17
Fixed version:     7.1.33
Installation
path / port:       8080/tcp
```

Impact
Successful exploitation would allow an unauthenticated remote attacker to execute arbitrary code on the target machine.

Solution:
Solution type: VendorFix
Update to version 7.1.33, 7.2.24, 7.3.11 or later.
As an alternative a workaround to update the nginx configuration to mitigate this vulnerability is described at the PHP.net bugtracker linked in the references.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
PHP prior to version 7.1.33, 7.2.x prior to 7.2.24 and 7.3.x prior to 7.3.11.

Vulnerability Insight
The file sapi/fpm/fpm/fpm_main.c contains pointer arithmetic that assumes that env_path_info has a prefix equal to the path to the php script. However, the code does not check this assumption is satisfied. The absence of the check can lead to an invalid pointer in the 'path_info' variable.
Such conditions can be achieved in a pretty standard Nginx configuration. The regexp in 'fastcgi_split_path_info' directive can be broken using the newline character (in encoded form, %0a). Broken regexp leads to empty PATH_INFO, which triggers the bug.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 7.1.33, 7.2.x < 7.2.24, 7.3.x < 7.3.11 RCE Vulnerability - Version Check`

NVT: PHP 7.0.0 <= 7.1.15 DoS Vulnerability (Aug 2018) - Linux

. . . continues on next page . . .

. . . continued from previous page . . .

Product detection result
`cpe:/a:php:php:7.0.17`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.17
Fixed version:     None
Installation
path / port:       8080/tcp
```

Impact
Successful exploitation will allow attackers to cause a denial of service by performing an integer overflow and therefore crashing the application.

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
PHP versions 7.x through 7.1.15.

Vulnerability Insight
The flaw exists due to how mysqli_real_escape_string function in mysqli/mysqli_api.c file improperly handles long strings.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP 7.0.0 <= 7.1.15 DoS Vulnerability (Aug 2018) - Linux`

NVT: PHP 5.x < 5.6.34, 7.x < 7.0.28, 7.1.x < 7.1.15, 7.2.x < 7.2.3 Stack Buffer Overflow Vulnerability (Mar 2018) - Linux

Product detection result

```
cpe:/a:php:php:7.0.17
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a stack buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.17
Fixed version:     7.0.28
Installation
path / port:       8080/tcp
```

Impact

Successful exploitation will allow an attacker to execute arbitrary code in the context of the affected application. Failed exploit attempts will result in denial-of-service conditions.

Solution:

Solution type: VendorFix

Update to version 5.6.34, 7.0.28, 7.1.15, 7.2.3 or later.

Affected Software/OS

PHP versions 5.x prior to 5.6.34, 7.x prior to 7.0.28, 7.1.x prior to 7.1.15 and 7.2.x prior to 7.2.3 on Linux.

Vulnerability Insight

The flaw exists because php fails to adequately bounds-check user-supplied data before copying it into an insufficiently sized buffer.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Installed version: 7.0.17
Fixed version: 8.1.31
Installation
path / port: 8080/tcp

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to version 8.1.31, 8.2.26, 8.3.14 or later.

Affected Software/OS
PHP versions prior to 8.1.31, 8.2.x prior to 8.2.26 and 8.3.x prior to 8.3.14.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2024-8929: Leak partial content of the heap through heap buffer over-read
- CVE-2024-8932: OOB access in ldap_escape
- CVE-2024-11233: Single byte overread with convert.quoted-printable-decode filter
- CVE-2024-11234: Configuring a proxy in a stream context might allow for CRLF injection in URIs
- CVE-2024-11236: Integer overflow in the firebird/dblib quoter causing OOB writes
- No CVE: Heap-Use-After-Free in sapi_read_post_data Processing in CLI SAPI Interface

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

```

Impact
Successfully exploiting these issues allow remote attackers to leak information from the interpreter, crash PHP interpreter and also disclose sensitive information.

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to version 5.6.31, 7.0.21, 7.1.7 or later.

Affected Software/OS
PHP prior to version 5.6.31, 7.0.x prior to 7.0.21 and 7.1.x prior to 7.1.7.

Vulnerability Insight
The following vulnerabilities exist:
- An ext/date/lib/parse_date.c out-of-bounds read affecting the php_parse_date function.
- The openssl extension PEM sealing code did not check the return value of the OpenSSL sealing function.
- lack of bounds checks in the date extension's timelib_meridian parsing code.
- A stack-based buffer overflow in the zend_ini_do_op() function in the 'Zend/zend_ini_parser.c' script.
- The GIF decoding function gdImageCreateFromGifCtx in gd_gif_in.c in the GD Graphics Library (aka libgd) does not zero colorMap arrays before use.
- Heap buffer overread (READ: 1) finish_nested_data from unserialize
- oniguruma upstream fix

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.31, 7.0.x < 7.0.21, 7.1.x < 7.1.7 Multiple Vulnerabilities (Jul 2017).`

Solution:
Solution type: VendorFix
Update to version 8.1.32, 8.2.28 or later.

Affected Software/OS
PHP versions prior to 8.1.32, and 8.2.x prior to 8.2.28.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2025-1217: Header parser of 'http' stream wrapper does not handle folded headers
- CVE-2025-1219: libxml streams use wrong 'content-type' header when requesting a redirected resource
- CVE-2025-1734: Streams HTTP wrapper does not fail for headers without colon
- CVE-2025-1736: Stream HTTP wrapper header check might omit basic auth header
- CVE-2025-1861: Stream HTTP wrapper truncate redirect location to 1024 bytes

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: PHP Multiple Vulnerabilities (Mar 2019) - Linux

Product detection result
`cpe:/a:php:php:7.0.17`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.17
Fixed version:     7.1.27
Installation
path / port:       8080/tcp
```

Solution:
Solution type: VendorFix
Update to version 7.1.27, 7.2.16, 7.3.3 or later.

Affected Software/OS
PHP version 7.x before 7.1.27, 7.2.x before 7.2.16 and 7.3.x before 7.3.3.

Vulnerability Insight
PHP is prone to multiple vulnerabilities:
- Due to the way rename() across filesystems is implemented, it is possible that file being renamed is briefly available with wrong permissions while the rename is ongoing, thus enabling unauthorized users to access the data. (CVE-2019-9637)
- Uninitialized read in exif_process_IFD_in_MAKERNOTE because of mishandling the maker_note->offset relationship to value_len (CVE-2019-9638)
- Uninitialized read in exif_process_IFD_in_MAKERNOTE because of mishandling the data_len variable (CVE-2019-9639)
- Invalid Read in exif_process_SOFn (CVE-2019-9640)
- Uninitialized read in exif_process_IFD_in_TIFF (CVE-2019-9641)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP Multiple Vulnerabilities (Mar 2019) - Linux`
OID:1.3.6.1.4.1.25623.1.0.142131

Critical (CVSS: 9.8)
NVT: PHP < 8.0.30, 8.1.x < 8.1.22, 8.2.x < 8.2.9 Security Update - Linux

Product detection result
cpe:/a:php:php:7.0.17
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

. . . continues on next page . . .

. . . continued from previous page . . .

```
Installed version: 7.0.17
Fixed version:     8.0.30
Installation
path / port:       8080/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.0.30, 8.1.22, 8.2.9 or later.

Affected Software/OS
PHP prior to version 8.0.30, 8.1.x prior to 8.1.22 and 8.2.x prior to 8.2.9.

Vulnerability Insight
The following flaws exist:
- CVE-2023-3823: Fixed bug GHSA-3qrf-m4j2-pcrr (Security issue with external entity loading in XML without enabling it)
- CVE-2023-3824: Fixed bug GHSA-jqcx-ccgc-xwhv (Buffer mismanagement in phar_dir_read())

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 8.0.30, 8.1.x < 8.1.22, 8.2.x < 8.2.9 Security Update - Linux`
OID:1.3.6.1.4.1.25623.1.0.170529

Critical (CVSS: 9.8)
NVT: PHP 7.0.x < 7.0.23, 7.1.x < 7.1.9 Use-After-Free Vulnerability - Linux

Product detection result
`cpe:/a:php:php:7.0.17`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to a use-after-free vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.17
Fixed version:     7.0.23
Installation
path / port:       8080/tcp
```

Solution:
Solution type: VendorFix
Update to version 7.0.23, 7.1.9 or later.

Affected Software/OS
PHP versions 7.0.x prior to 7.0.23 and 7.1.x prior to 7.1.9.

Vulnerability Insight
ext/standard/var_unserializer.re is prone to a heap use after free while unserializing untrusted data, related to improper use of the hash API for key deletion in a situation with an invalid array size. Exploitation of this issue can have an unspecified impact on the integrity of PHP.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP 7.0.x < 7.0.23, 7.1.x < 7.1.9 Use-After-Free Vulnerability - Linux`

Critical (CVSS: 9.8)
NVT: PHP <= 7.1.5 Multiple DoS Vulnerabilities

Product detection result
cpe:/a:php:php:7.0.17
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to multiple denial of service (DoS) vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 7.0.17
Fixed version: None
Installation
path / port: 8080/tcp

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS
PHP versions through 7.1.5.

Vulnerability Insight
The following flaws exist:

. . . continues on next page . . .

. . . continued from previous page . . .

- CVE-2017-8923: The zend_string_extend function in Zend/zend_string.h does not prevent changes to string objects that result in a negative length, which allows remote attackers to cause a denial of service (application crash) or possibly have unspecified other impact by leveraging a script's use of .= with a long string.
- CVE-2017-9119: The i_zval_ptr_dtor function in Zend/zend_variables.h allows attackers to cause a denial of service (memory consumption and application crash) or possibly have unspecified other impact by triggering crafted operations on array data structures.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.
Details: `PHP <= 7.1.5 Multiple DoS Vulnerabilities`
OID:1.3.6.1.4.1.25623.1.0.117799

cpe:/a:php:php:7.0.17
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.17
Fixed version:     7.4.33
Installation
path / port:       8080/tcp
```

Solution:
Solution type: VendorFix
Update to version 7.4.33, 8.0.25, 8.1.12 or later.

Affected Software/OS
PHP prior to version 7.4.33, version 8.0.x through 8.0.24 and 8.1.x through 8.1.11.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2022-31630: OOB read due to insufficient input validation in imageloadfont()
- CVE-2022-37454: Buffer overflow in hash_update() on long parameter

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: PHP < 7.4.28, 8.0.x < 8.0.16, 8.1.x < 8.1.3 Security Update (Feb 2022) - Linux

Product detection result

```
cpe:/a:php:php:7.0.17
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP released new versions which include a security fix.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.17
Fixed version:     7.4.28
Installation
path / port:       8080/tcp
```

Solution:

Solution type: VendorFix

Update to version 7.4.28, 8.0.16, 8.1.3 or later.

Affected Software/OS

PHP prior to version 7.4.28, 8.0.x through 8.0.15 and 8.1.x through 8.1.2.

Vulnerability Insight

Fix #81708: UAF due to php_filter_float() failing for ints.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

cpe:/a:php:php:7.0.17
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Installed version: 7.0.17
Fixed version:     7.1.26
Installation
path / port:       8080/tcp
```

Solution:
Solution type: VendorFix
Update to version 5.6.40, 7.1.16, 7.2.14, 7.3.1 or later.

Affected Software/OS
PHP versions before 5.6.40, 7.x before 7.1.26, 7.2.x before 7.2.14 and 7.3.x before 7.3.1.

Vulnerability Insight
The following flaws exist:
- Fixed bug #77269 (efree() on uninitialized Heap data in imagescale leads to use-after-free). (CVE-2016-10166)
- Fixed bug #77270 (imagecolormatch Out Of Bounds Write on Heap). (CVE-2019-6977)
- Fixed bug #77370 (Buffer overflow on mb regex functions - fetch_token). (CVE-2019-9023)
- Fixed bug #77371 (heap buffer overflow in mb regex functions - compile_string_node). (CVE-2019-9023)
- Fixed bug #77381 (heap buffer overflow in multibyte match_at). (CVE-2019-9023)
- Fixed bug #77382 (heap buffer overflow due to incorrect length in expand_case_fold_string). (CVE-2019-9023)
- Fixed bug #77385 (buffer overflow in fetch_token). (CVE-2019-9023)
- Fixed bug #77394 (Buffer overflow in multibyte case folding - unicode). (CVE-2019-9023)
- Fixed bug #77418 (Heap overflow in utf32be_mbc_to_code). (CVE-2019-9023)
- Fixed bug #77247 (heap buffer overflow in phar_detect_phar_fname_ext). (CVE-2019-9021)
- Fixed bug #77242 (heap out of bounds read in xmlrpc_decode()). (CVE-2019-9020)
- Fixed bug #77380 (Global out of bounds read in xmlrpc base64 code). (CVE-2019-9024)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: Adminer < 4.7.8 SSRF Vulnerability - Linux

Summary
Adminer is prone to a server-side request forgery (SSRF) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 4.2.5
Fixed version:     4.7.8
Installation
path / port:       /
```

Impact
This vulnerability can be used to potentially bypass firewalls to identify internal hosts and perform port scanning of other servers for reconnaissance purposes.

Solution:
Solution type: Mitigation
Update to version 4.7.8 or later.
Note: Version 4.4.0 only partially mitigating this vulnerability for privileged ports (ports in the range of <= 1024) but version 4.7.8 or later is required to fully mitigating this vulnerability for unprivileged ports (in the range of > 1024).

Affected Software/OS
Adminer versions prior to 4.7.8.

Vulnerability Insight
Adminer allows unauthenticated connections to be initiated to arbitrary systems/ports.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Adminer < 4.7.8 SSRF Vulnerability - Linux`
OID:1.3.6.1.4.1.25623.1.0.108532

NVT: PHP 'CVE-2019-13224' Use-After-Free Vulnerability - Linux

Product detection result

```
cpe:/a:php:php:7.0.17
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a use-after-free vulnerability in a used third-pary library.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.17
Fixed version:     7.1.32
Installation
path / port:       8080/tcp
```

Impact

This flaw allows attackers to potentially cause information disclosure, denial of service, or possibly code execution by providing a crafted regular expression.

Solution:

Solution type: VendorFix

Update to version 7.1.32, 7.3.9 or later.

Affected Software/OS

PHP version before 7.1.32 and 7.3.x before 7.3.9.

Vulnerability Insight

The flaw exists due to a use-after-free in onig_new_deluxe() in regext.c of the third-party library Oniguruma 6.9.2 which is used by PHP.

The attacker provides a pair of a regex pattern and a string, with a multi-byte encoding that gets handled by onig_new_deluxe().

Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)

. . . continues on next page . . .

. . . continued from previous page . . .

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.17
Fixed version:     7.0.30
Installation
path / port:       8080/tcp
```

Impact
Successful exploitation will allow an attacker to conduct XSS attacks, crash PHP, conduct denial of service condition and execute arbitrary code in the context of the affected application.

Solution:
Solution type: VendorFix
Update to version 5.6.36, 7.0.30, 7.1.17, 7.2.5 or later.

Affected Software/OS
PHP prior to version 5.6.36, 7.0.x prior to 7.0.30, 7.1.x prior to 7.1.17 and 7.2.x prior to 7.2.5 on Linux.

Vulnerability Insight
The following flaws exist:
- CVE-2018-10549: Out of bounds read error in 'exif_read_data' function while processing crafted JPG data.
- CVE-2018-10546: An error in stream filter 'convert.iconv' which leads to infinite loop on invalid sequence.
- CVE-2018-10548: An error in the LDAP module of PHP which allows a malicious LDAP server or man-in-the-middle attacker to crash PHP.
- CVE-2018-10547: An error in the 'phar_do_404()' function in 'ext/phar/phar_object.c' script which returns parts of the request unfiltered, leading to another XSS vector. This is due to incomplete fix for CVE-2018-5712.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.36, 7.x < 7.0.30, 7.1.x < 7.1.17, 7.2.x < 7.2.5 Multiple Vulnerabilit.`

```

Summary

The Operating System (OS) on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The "Debian GNU/Linux" Operating System on the remote host has reached the end o
↪f life.
CPE:                cpe:/o:debian:debian_linux:9
Installed version,
build or SP:        9
EOL date:           2022-06-30
```

. . . continues on next page . . .

. . . continued from previous page . . .

EOL info: https://en.wikipedia.org/wiki/List_of_Debian_releases#Release
↪_table

Impact
An EOL version of an OS is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: Mitigation
Update the OS on the remote host to a version which is still supported and receiving security updates by the vendor.
Note / Important: Please create an override for this result if the target host is a:
- Windows system with Extended Security Updates (ESU)
- System with additional 3rd-party / non-vendor security updates like e.g. from 'TuxCare', 'Freexian Extended LTS' or similar

Vulnerability Detection Method
Checks if an EOL version of an OS is present on the target host.
Details: Operating System (OS) End of Life (EOL) Detection

2.36.2 Critical 80/tcp

Critical (CVSS: 9.8)
NVT: Apache HTTP Server Multiple Vulnerabilities (Jun 2017) - Linux

Product detection result
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.26
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow remote attackers to bypass authentication and perform unauthorized actions, cause a denial-of-service condition and gain access to potentially sensitive information.

Solution:

Solution type: VendorFix

Update to Apache HTTP Server 2.2.33 or 2.4.26 or later.

Affected Software/OS

Apache HTTP Server 2.2.x before 2.2.33 and 2.4.x before 2.4.26.

Vulnerability Insight

Multiple flaws exist as,

- The mod_mime can read one byte past the end of a buffer when sending a malicious Content-Type response header.

- The mod_ssl may dereference a NULL pointer when third-party modules call ap_hook_process_connection() during an HTTP request to an HTTPS port.

- An use of the ap_get_basic_auth_pw() by third-party modules outside of the authentication phase may lead to authentication requirements being bypassed.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.53
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.53 or later.

Affected Software/OS
Apache HTTP Server version 2.4.52 and prior.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2022-22719: mod_lua Use of uninitialized value of in r:parsebody
- CVE-2022-22720: HTTP request smuggling vulnerability
- CVE-2022-22721: Possible buffer overflow with very large or unlimited LimitXMLRequestBody
- CVE-2022-23943: mod_sed: Read/write beyond bounds

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

```

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

Successful exploitation will allow an attacker to replay HTTP requests across servers without detection, influence the user content, upload a malicious file, crash the Apache HTTP Server and perform denial of service attack.

Solution:
Solution type: VendorFix
Update to version 2.4.30 or later. Please see the references for more information.

Affected Software/OS
Apache HTTP Server versions from 2.4.1 to 2.4.4, 2.4.6, 2.4.7, 2.4.9, 2.4.10, 2.4.12, 2.4.16 to 2.4.18, 2.4.20, 2.4.23, 2.4.25 to 2.4.29.

Vulnerability Insight
Multiple flaws exist due to:
- Apache HTTP Server fails to correctly generate the nonce sent to prevent reply attacks.
- Misconfigured mod_session variable, HTTP_SESSION.
- Apache HTTP Server fails to sanitize the expression specified in '<FilesMatch>'.
- An error in Apache HTTP Server 'mod_authnz_ldap' when configured with AuthLDAPCharsetConfig.
- Apache HTTP Server fails to sanitize against a specially crafted request.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

```

Summary

Apache HTTP Server is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.52
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 2.4.52 or later.

Affected Software/OS

Apache HTTP Server versions through 2.4.51.

Vulnerability Insight

A carefully crafted request body can cause a buffer overflow in the mod_lua multipart parser (r:parsebody() called from Lua scripts).

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.48
Installation
path / port:       80/tcp
```

Impact
- CVE-2020-35452: A specially crafted Digest nonce can cause a stack overflow in mod_auth_digest.
- CVE-2021-26690: A specially crafted Cookie header handled by mod_session can cause a NULL pointer dereference and crash, leading to a possible Denial Of Service.
- CVE-2021-26691: A specially crafted SessionHeader sent by an origin server could cause a heap overflow.

Solution:
Solution type: VendorFix
Update to version 2.4.48 or later.

Affected Software/OS
Apache HTTP Server versions 2.4.0 to 2.4.46 on Linux.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2020-35452: mod_auth_digest possible stack overflow by one null byte
- CVE-2021-26690: mod_session NULL pointer dereference
- CVE-2021-26691: mod_session response handling heap overflow

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a HTTP request smuggling vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.56
Installation
path / port:       80/tcp
```

Impact

Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

Solution:

Solution type: VendorFix

Update to version 2.4.56 or later.

Affected Software/OS

Apache HTTP Server versions 2.4.0 through 2.4.55.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
Some mod_proxy configurations allow a HTTP Request Smuggling attack.
Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

. . . continued from previous page . . .

Product detection result
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.27
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow remote attackers to cause the target service to crash. A remote user can obtain potentially sensitive information as well on the target system.

Solution:
Solution type: VendorFix
Update to Apache HTTP Server 2.2.34 or 2.4.27 or later.

Affected Software/OS
Apache HTTP Server 2.2.x before 2.2.34 and 2.4.x before 2.4.27.

Vulnerability Insight
The flaw exists due to error in Apache 'mod_auth_digest' which does not properly initialize memory used to process 'Digest' type HTTP Authorization headers.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux

. . . continued from previous page . . .

path / port: 80/tcp

Solution:
Solution type: VendorFix
Update to version 2.4.52 or later.

Affected Software/OS
Apache HTTP Server version 2.4.7 through 2.4.51.

Vulnerability Insight
A crafted URI sent to httpd configured as a forward proxy (ProxyRequests on) can cause a crash (NULL pointer dereference) or, for configurations mixing forward and reverse proxy declarations, can allow for requests to be directed to a declared Unix Domain Socket endpoint (Server Side Request Forgery).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

```

Summary

The Operating System (OS) on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The "Debian GNU/Linux" Operating System on the remote host has reached the end o
↪f life.
CPE:                cpe:/o:debian:debian_linux:9
Installed version,
build or SP:        9
EOL date:           2022-06-30
EOL info:           https://en.wikipedia.org/wiki/List_of_Debian_releases#Release
↪_table
```

Impact

An EOL version of an OS is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: Mitigation
Update the OS on the remote host to a version which is still supported and receiving security updates by the vendor.
Note / Important: Please create an override for this result if the target host is a:
- Windows system with Extended Security Updates (ESU)
- System with additional 3rd-party / non-vendor security updates like e.g. from 'TuxCare', 'Freexian Extended LTS' or similar

Vulnerability Detection Method
Checks if an EOL version of an OS is present on the target host.
Details: `Operating System (OS) End of Life (EOL) Detection`

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.53
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 2.4.53 or later.

Affected Software/OS

Apache HTTP Server version 2.4.52 and prior.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2022-22719: mod_lua Use of uninitialized value of in r:parsebody
- CVE-2022-22720: HTTP request smuggling vulnerability
- CVE-2022-22721: Possible buffer overflow with very large or unlimited LimitXMLRequestBody
- CVE-2022-23943: mod_sed: Read/write beyond bounds

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server <= 2.4.52 Multiple Vulnerabilities - Linux`

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.60
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 2.4.60 or later.

Affected Software/OS

Apache HTTP Server version 2.4.59 and prior.

Vulnerability Insight

The following flaws exist:

- CVE-2024-36387: Denial of Service (DoS) by Null pointer in websocket over HTTP/2
- CVE-2024-38473: Proxy encoding problem
- CVE-2024-38474: Weakness with encoded question marks in backreferences
- CVE-2024-38475: Weakness in mod_rewrite when first segment of substitution matches filesystem path
- CVE-2024-38476: May use exploitable/malicious backend application output to run local handlers via internal redirect
- CVE-2024-38477: Crash resulting in DoS in mod_proxy via a malicious request
- CVE-2024-39573: mod_rewrite proxy handler substitution

Product detection result

```
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.26
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow remote attackers to bypass authentication and perform unauthorized actions, cause a denial-of-service condition and gain access to potentially sensitive information.

Solution:

Solution type: VendorFix

Update to Apache HTTP Server 2.2.33 or 2.4.26 or later.

Affected Software/OS

Apache HTTP Server 2.2.x before 2.2.33 and 2.4.x before 2.4.26.

Vulnerability Insight

Multiple flaws exist as,

. . . continues on next page . . .

. . . continued from previous page . . .

- The mod_mime can read one byte past the end of a buffer when sending a malicious Content-Type response header.
- The mod_ssl may dereference a NULL pointer when third-party modules call ap_hook_process_connection() during an HTTP request to an HTTPS port.
- An use of the ap_get_basic_auth_pw() by third-party modules outside of the authentication phase may lead to authentication requirements being bypassed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Product detection result

```
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.30
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow an attacker to replay HTTP requests across servers without detection, influence the user content, upload a malicious file, crash the Apache HTTP Server and perform denial of service attack.

Solution:

Solution type: VendorFix

Update to version 2.4.30 or later. Please see the references for more information.

Affected Software/OS

Apache HTTP Server versions from 2.4.1 to 2.4.4, 2.4.6, 2.4.7, 2.4.9, 2.4.10, 2.4.12, 2.4.16 to 2.4.18, 2.4.20, 2.4.23, 2.4.25 to 2.4.29.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
Multiple flaws exist due to:
- Apache HTTP Server fails to correctly generate the nonce sent to prevent reply attacks.
- Misconfigured mod_session variable, HTTP_SESSION.
- Apache HTTP Server fails to sanitize the expression specified in '<FilesMatch>'.
- An error in Apache HTTP Server 'mod_authnz_ldap' when configured with AuthLDAPCharsetConfig.
- Apache HTTP Server fails to sanitize against a specially crafted request.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Apache HTTP Server versions through 2.4.51.

Vulnerability Insight
A carefully crafted request body can cause a buffer overflow in the mod_lua multipart parser (r:parsebody() called from Lua scripts).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux`
OID:1.3.6.1.4.1.25623.1.0.117856
Version used: `2021-12-23T12:12:57Z`

Product Detection Result
Product: `cpe:/a:apache:http_server:2.4.25`
Method: `Apache HTTP Server Detection Consolidation`
OID: 1.3.6.1.4.1.25623.1.0.117232)

NVT: Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a HTTP request smuggling vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.56
Installation
path / port:       80/tcp
```

Impact

Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

Solution:

Solution type: VendorFix

Update to version 2.4.56 or later.

Affected Software/OS

Apache HTTP Server versions 2.4.0 through 2.4.55.

Vulnerability Insight

Some mod_proxy configurations allow a HTTP Request Smuggling attack.
Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary
Apache HTTP Server is prone to a memory access vulnerability.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.41
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.41 or later.

Affected Software/OS
Apache HTTP Server version 2.4.18 to 2.4.39.

Vulnerability Insight
Using fuzzed network input, the http/2 session handling could be made to read memory after being freed during connection shutdown.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server Memory Access Vulnerability - Linux`
OID:1.3.6.1.4.1.25623.1.0.114149

NVT: Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux

Product detection result
`cpe:/a:apache:http_server:2.4.25`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.27
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow remote attackers to cause the target service to crash. A remote user can obtain potentially sensitive information as well on the target system.

Solution:
Solution type: VendorFix
Update to Apache HTTP Server 2.2.34 or 2.4.27 or later.

Affected Software/OS
Apache HTTP Server 2.2.x before 2.2.34 and 2.4.x before 2.4.27.

Vulnerability Insight
The flaw exists due to error in Apache 'mod_auth_digest' which does not properly initialize memory used to process 'Digest' type HTTP Authorization headers.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux`

NVT: Apache HTTP Server 2.4.7 - 2.4.51 Multiple Vulnerabilities - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.52
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 2.4.52 or later.

Affected Software/OS

Apache HTTP Server version 2.4.7 through 2.4.51.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

A crafted URI sent to httpd configured as a forward proxy (ProxyRequests on) can cause a crash (NULL pointer dereference) or, for configurations mixing forward and reverse proxy declarations, can allow for requests to be directed to a declared Unix Domain Socket endpoint (Server Side Request Forgery).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 2.4.7 - 2.4.51 Multiple Vulnerabilities - Linux`

2.38.1 Critical 80/tcp

Critical (CVSS: 10.0)
NVT: Nginx End of Life (EOL) Detection

Product detection result
`cpe:/a:f5:nginx:1.10.3`
`Detected by nginx Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.113787)`

Summary
The Nginx version on the remote host has reached the End of Life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "Nginx" version on the remote host has reached the end of life.
CPE:                cpe:/a:nginx:nginx:1.10.3
Installed version:  1.10.3
Location/URL:       80/tcp
EOL version:        1.10
EOL date:           2017-04-12
```

Impact
An EOL version of Nginx is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: VendorFix
Update the Nginx version on the remote host to a still supported version.

Vulnerability Detection Method
Checks if an EOL version is present on the target host.
Details: `Nginx End of Life (EOL) Detection`
OID:1.3.6.1.4.1.25623.1.0.148940
Version used: `2025-04-15T05:54:49Z`

Product Detection Result
Product: `cpe:/a:f5:nginx:1.10.3`

NVT: nginx < 1.13.6 Buffer Overflow Vulnerability

Product detection result
`cpe:/a:f5:nginx:1.10.3`
`Detected by nginx Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.113787)`

Summary
nginx is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 1.10.3
Fixed version:     1.13.6
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 1.13.6 or later.

Affected Software/OS
nginx before version 1.13.6.

Vulnerability Insight
The buffer overflow exists for years that exceed four digits, as demonstrated by a file with a modification date in 1969 that causes an integer overflow (or a false modification date far in the future), when encountered by the autoindex module.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `nginx < 1.13.6 Buffer Overflow Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.117471

Critical (CVSS: 9.8)
NVT: Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.52
Installation
path / port:       80/tcp
```

Solution:

Solution type: VendorFix

Update to version 2.4.52 or later.

Affected Software/OS

Apache HTTP Server versions through 2.4.51.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
A carefully crafted request body can cause a buffer overflow in the mod_lua multipart parser (r:parsebody() called from Lua scripts).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux`
OID:1.3.6.1.4.1.25623.1.0.117856

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.30
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow an attacker to replay HTTP requests across servers without detection, influence the user content, upload a malicious file, crash the Apache HTTP Server and perform denial of service attack.

Solution:
Solution type: VendorFix
Update to version 2.4.30 or later. Please see the references for more information.

Affected Software/OS
Apache HTTP Server versions from 2.4.1 to 2.4.4, 2.4.6, 2.4.7, 2.4.9, 2.4.10, 2.4.12, 2.4.16 to 2.4.18, 2.4.20, 2.4.23, 2.4.25 to 2.4.29.

Vulnerability Insight
Multiple flaws exist due to:
- Apache HTTP Server fails to correctly generate the nonce sent to prevent reply attacks.
- Misconfigured mod_session variable, HTTP_SESSION.
- Apache HTTP Server fails to sanitize the expression specified in '<FilesMatch>'.
- An error in Apache HTTP Server 'mod_authnz_ldap' when configured with AuthLDAPCharsetConfig.
- Apache HTTP Server fails to sanitize against a specially crafted request.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.26
Installation
path / port:       80/tcp
```

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

Successful exploitation will allow remote attackers to bypass authentication and perform unauthorized actions, cause a denial-of-service condition and gain access to potentially sensitive information.

Solution:
Solution type: VendorFix
Update to Apache HTTP Server 2.2.33 or 2.4.26 or later.

Affected Software/OS
Apache HTTP Server 2.2.x before 2.2.33 and 2.4.x before 2.4.26.

Vulnerability Insight
Multiple flaws exist as,
- The mod_mime can read one byte past the end of a buffer when sending a malicious Content-Type response header.
- The mod_ssl may dereference a NULL pointer when third-party modules call ap_hook_process_connection() during an HTTP request to an HTTPS port.
- An use of the ap_get_basic_auth_pw() by third-party modules outside of the authentication phase may lead to authentication requirements being bypassed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Affected Software/OS
Apache HTTP Server versions 2.4.0 to 2.4.46 on Linux.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2020-35452: mod_auth_digest possible stack overflow by one null byte
- CVE-2021-26690: mod_session NULL pointer dereference
- CVE-2021-26691: mod_session response handling heap overflow

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 2.4.0 - 2.4.46 Multiple Vulnerabilities - Linux`
OID:1.3.6.1.4.1.25623.1.0.112897
Version used: `2021-08-24T09:01:06Z`

NVT: Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a HTTP request smuggling vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.56
Installation
path / port:       80/tcp
```

Impact

Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

Solution:

Solution type: VendorFix

Update to version 2.4.56 or later.

Affected Software/OS

Apache HTTP Server versions 2.4.0 through 2.4.55.

Vulnerability Insight

Some mod_proxy configurations allow a HTTP Request Smuggling attack.
Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux`

. . . continued from previous page . . .

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.41
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.41 or later.

Affected Software/OS
Apache HTTP Server version 2.4.18 to 2.4.39.

Vulnerability Insight
Using fuzzed network input, the http/2 session handling could be made to read memory after being freed during connection shutdown.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server Memory Access Vulnerability - Linux`
OID:1.3.6.1.4.1.25623.1.0.114149

Product detection result
`cpe:/a:apache:http_server:2.4.25`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.27
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow remote attackers to cause the target service to crash. A remote user can obtain potentially sensitive information as well on the target system.

Solution:
Solution type: VendorFix
Update to Apache HTTP Server 2.2.34 or 2.4.27 or later.

Affected Software/OS
Apache HTTP Server 2.2.x before 2.2.34 and 2.4.x before 2.4.27.

Vulnerability Insight
The flaw exists due to error in Apache 'mod_auth_digest' which does not properly initialize memory used to process 'Digest' type HTTP Authorization headers.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux`

```

Summary

The Operating System (OS) on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The "Debian GNU/Linux" Operating System on the remote host has reached the end o
↪f life.
CPE:                cpe:/o:debian:debian_linux:9
Installed version,
build or SP:        9
EOL date:           2022-06-30
EOL info:           https://en.wikipedia.org/wiki/List_of_Debian_releases#Release
↪_table
```

Impact

An EOL version of an OS is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: Mitigation
Update the OS on the remote host to a version which is still supported and receiving security updates by the vendor.
Note / Important: Please create an override for this result if the target host is a:
- Windows system with Extended Security Updates (ESU)
- System with additional 3rd-party / non-vendor security updates like e.g. from 'TuxCare', 'Freexian Extended LTS' or similar

Vulnerability Detection Method
Checks if an EOL version of an OS is present on the target host.

NVT: MariaDB Access Bypass Vulnerability - Linux

Product detection result

```
cpe:/a:mariadb:mariadb:10.0.38
Detected by MariaDB / Oracle MySQL Detection (MySQL Protocol) (OID: 1.3.6.1.4.1.
↪25623.1.0.100152)
```

. . . continues on next page . . .

. . . continued from previous page . . .

Summary
MariaDB is prone to an access bypass vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 10.0.38
Fixed version:     10.1.30
```

Impact
A user with an SQL access to the server could possibly use this flaw to perform database modification on certain cluster nodes without having privileges to perform such changes.

Solution:
Solution type: VendorFix
Update to MariaDB 10.1.30, 10.2.10 or later.

Affected Software/OS
MariaDB before 10.1.30 and 10.2.x before 10.2.10.

Vulnerability Insight
sql/event_data_objects.cc in MariaDB allows remote authenticated users with SQL access to bypass intended access restrictions and replicate data definition language (DDL) statements to cluster nodes by leveraging incorrect ordering of DDL replication and ACL checking.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `MariaDB Access Bypass Vulnerability - Linux`
OID:1.3.6.1.4.1.25623.1.0.112198
Version used: `2025-09-09T05:38:49Z`

Product Detection Result
Product: `cpe:/a:mariadb:mariadb:10.0.38`
Method: `MariaDB / Oracle MySQL Detection (MySQL Protocol)`
OID: 1.3.6.1.4.1.25623.1.0.100152)

</web-app>
 AB \x0002\x0005\x0001
```

Solution:
Solution type: VendorFix
- Update Apache Tomcat to version 7.0.100, 8.5.51, 9.0.31 or later
- For other products using Tomcat please contact the vendor for more information on fixed versions

Affected Software/OS
Apache Tomcat versions prior 7.0.100, 8.5.51 or 9.0.31 when the AJP connector is enabled. Other products like JBoss or Wildfly which are using Tomcat might be affected as well.

Vulnerability Insight
Apache Tomcat server has a file containing vulnerability, which can be used by an attacker to read or include any files in all webapp directories on Tomcat, such as webapp configuration files or source code.

Vulnerability Detection Method
Sends a crafted AJP request and checks the response.
Details: `Apache Tomcat AJP RCE Vulnerability (Ghostcat) - Active Check`

NVT: Apache Tomcat RCE Vulnerability (Mar 2025) - Linux

Product detection result
```
cpe:/a:apache:tomcat:6.0.53
Detected by Apache Tomcat Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.10
↪7652)
```

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

Apache Tomcat is prone to a remote code execution (RCE) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 6.0.53
Fixed version:     9.0.99
Installation
path / port:       8080/tcp
```

Solution:
Solution type: VendorFix
Update to version 9.0.99, 10.1.35, 11.0.3 or later.

Affected Software/OS
Apache Tomcat version 9.0.98 and prior, 10.x through 10.1.34 and 11.0.0-M1 through 11.0.2.
Note: While not explicitly mentioned by the vendor (due to the EOL status of these branches) it is assumed that the whole 10.x branch and all versions prior to 9.x are affected by these flaws. If you disagree with this assessment and want to accept the risk please create an override for this result.

Vulnerability Insight
The original implementation of partial PUT used a temporary file based on the user provided file name and path with the path separator replaced by '.'.
If all of the following are true, a malicious user is able to view security sensitive files and/or inject content into those files:
- writes enabled for the default servlet (disabled by default)
- support for partial PUT (enabled by default)
- a target URL for security sensitive uploads that is a sub-directory of a target URL for public uploads
- attacker knowledge of the names of security sensitive files being uploaded
- the security sensitive files also being uploaded via partial PUT
If all of the following are true, a malicious user is able to perform remote code execution:
- writes enabled for the default servlet (disabled by default)
- support for partial PUT (enabled by default)
- application is using Tomcat's file based session persistence with the default storage location
- application includes a library that may be leveraged in a deserialization attack

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache Tomcat RCE Vulnerability (Mar 2025) - Linux`

NVT: Apache Tomcat Rewrite Rule Bypass Vulnerability (Apr 2025) - Linux

Product detection result

```
cpe:/a:apache:tomcat:6.0.53
Detected by Apache Tomcat Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.10
↪7652)
```

Summary

Apache Tomcat is prone to a rewrite rule bypass vulnerability.

Quality of Detection (QoD): 30%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Installed version: 6.0.53
Fixed version:     9.0.104
Installation
path / port:       8080/tcp
```

Solution:
Solution type: VendorFix
Update to version 9.0.104, 10.1.40, 11.0.6 or later.

Affected Software/OS
Apache Tomcat version 9.0.102 and prior, 10.x through 10.1.39 and 11.0.0-M1 through 11.0.5. Note: While not explicitly mentioned by the vendor (due to the EOL status of these branches) it is assumed that the whole 10.x branch and all versions prior to 9.x are affected by these flaws. If you disagree with this assessment and want to accept the risk please create an override for this result.

Vulnerability Insight
For a subset of unlikely rewrite rule configurations, it is possible for a specially crafted request to bypass some rewrite rules. If those rewrite rules effectively enforced security constraints, those constraints could be bypassed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

```
cpe:/a:php:php:7.0.17
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

The PHP version on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "PHP" version on the remote host has reached the end of life.
CPE:                cpe:/a:php:php:7.0.17
Installed version:  7.0.17
EOL version:        7.0
EOL date:           2019-01-10
```

. . . continues on next page . . .

. . . continued from previous page . . .

Impact
An EOL version of PHP is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: VendorFix
Update the PHP version on the remote host to a still supported version.

Vulnerability Insight
Each release branch of PHP is fully supported for two years from its initial stable release. During this period, bugs and security issues that have been reported are fixed and are released in regular point releases.
After this two year period of active support, each branch is then supported for an additional year for critical security issues only. Releases during this period are made on an as-needed basis: there may be multiple point releases, or none, depending on the number of reports.
Once the three years of support are completed, the branch reaches its end of life and is no longer supported.

Vulnerability Detection Method
Checks if an EOL version is present on the target host.
Details: `PHP End of Life (EOL) Detection - Linux`
OID:1.3.6.1.4.1.25623.1.0.105889

Product detection result
`cpe:/a:php:php:7.0.17`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

PHP is prone to a stack buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.17
Fixed version:     7.0.28
Installation
path / port:       8080/tcp
```

Impact

Successful exploitation will allow an attacker to execute arbitrary code in the context of the affected application. Failed exploit attempts will result in denial-of-service conditions.

Solution:

Solution type: VendorFix

Update to version 5.6.34, 7.0.28, 7.1.15, 7.2.3 or later.

Affected Software/OS

PHP versions 5.x prior to 5.6.34, 7.x prior to 7.0.28, 7.1.x prior to 7.1.15 and 7.2.x prior to 7.2.3 on Linux.

Vulnerability Insight

The flaw exists because php fails to adequately bounds-check user-supplied data before copying it into an insufficiently sized buffer.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `PHP 5.x < 5.6.34, 7.x < 7.0.28, 7.1.x < 7.1.15, 7.2.x < 7.2.3 Stack Buffer Over.`

Critical (CVSS: 9.8)
NVT: Adminer < 4.16.0 Multiple Vulnerabilities

Summary
Adminer is prone to multiple vulnerabilities.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
Installed version: 4.2.5
Fixed version:     4.16.0
Installation
path / port:       /
```

Solution:
Solution type: VendorFix
Update to version 4.16.0 or later.

Affected Software/OS
Adminer versions prior to 4.16.0.

Vulnerability Insight
The following flaws exist:
- CVE-2023-45195: Server-side request forgery (SSRF) vulnerability
- CVE-2023-45196: Denial-of-service (DoS) vulnerability
- CVE-2023-45197: File upload vulnerability

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Adminer < 4.16.0 Multiple Vulnerabilities`

Critical (CVSS: 9.8)
NVT: PHP < 5.6.31, 7.0.x < 7.0.21, 7.1.x < 7.1.7 Multiple Vulnerabilities (Jul 2017) - Linux

Product detection result

```
cpe:/a:php:php:7.0.17
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

. . . continues on next page . . .

. . . continued from previous page . . .

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.17
Fixed version:     7.0.21
Installation
path / port:       8080/tcp
```

Impact
Successfully exploiting these issues allow remote attackers to leak information from the interpreter, crash PHP interpreter and also disclose sensitive information.

Solution:
Solution type: VendorFix
Update to version 5.6.31, 7.0.21, 7.1.7 or later.

Affected Software/OS
PHP prior to version 5.6.31, 7.0.x prior to 7.0.21 and 7.1.x prior to 7.1.7.

Vulnerability Insight
The following vulnerabilities exist:
- An ext/date/lib/parse_date.c out-of-bounds read affecting the php_parse_date function.
- The openssl extension PEM sealing code did not check the return value of the OpenSSL sealing function.
- lack of bounds checks in the date extension's timelib_meridian parsing code.
- A stack-based buffer overflow in the zend_ini_do_op() function in the 'Zend/zend_ini_parser.c' script.
- The GIF decoding function gdImageCreateFromGifCtx in gd_gif_in.c in the GD Graphics Library (aka libgd) does not zero colorMap arrays before use.
- Heap buffer overread (READ: 1) finish_nested_data from unserialize
- oniguruma upstream fix

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 5.6.31, 7.0.x < 7.0.21, 7.1.x < 7.1.7 Multiple Vulnerabilities (Jul 2017).`

Critical (CVSS: 9.8)
NVT: PHP 'CVE-2019-13224' Use-After-Free Vulnerability - Linux

Product detection result
`cpe:/a:php:php:7.0.17`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to a use-after-free vulnerability in a used third-pary library.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.17
Fixed version:     7.1.32
Installation
path / port:       8080/tcp
```

Impact
This flaw allows attackers to potentially cause information disclosure, denial of service, or possibly code execution by providing a crafted regular expression.

Solution:
Solution type: VendorFix
Update to version 7.1.32, 7.3.9 or later.

Affected Software/OS
PHP version before 7.1.32 and 7.3.x before 7.3.9.

Vulnerability Insight
The flaw exists due to a use-after-free in onig_new_deluxe() in regext.c of the third-party library Oniguruma 6.9.2 which is used by PHP.
The attacker provides a pair of a regex pattern and a string, with a multi-byte encoding that gets handled by onig_new_deluxe().

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP 'CVE-2019-13224' Use-After-Free Vulnerability - Linux`

Critical (CVSS: 9.8)
NVT: PHP < 7.1.33, 7.2.x < 7.2.24, 7.3.x < 7.3.11 RCE Vulnerability - Version Check

Product detection result

```
cpe:/a:php:php:7.0.17
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to a remote code execution (RCE) vulnerability in certain nginx + php-fpm configurations.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.17
Fixed version:     7.1.33
Installation
path / port:       8080/tcp
```

Impact

Successful exploitation would allow an unauthenticated remote attacker to execute arbitrary code on the target machine.

Solution:

Solution type: VendorFix

Update to version 7.1.33, 7.2.24, 7.3.11 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

As an alternative a workaround to update the nginx configuration to mitigate this vulnerability is described at the PHP.net bugtracker linked in the references.

Affected Software/OS
PHP prior to version 7.1.33, 7.2.x prior to 7.2.24 and 7.3.x prior to 7.3.11.

Vulnerability Insight
The file sapi/fpm/fpm/fpm_main.c contains pointer arithmetic that assumes that env_path_info has a prefix equal to the path to the php script. However, the code does not check this assumption is satisfied. The absence of the check can lead to an invalid pointer in the 'path_info' variable.
Such conditions can be achieved in a pretty standard Nginx configuration. The regexp in 'fastcgi_split_path_info' directive can be broken using the newline character (in encoded form, %0a). Broken regexp leads to empty PATH_INFO, which triggers the bug.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 7.1.33, 7.2.x < 7.2.24, 7.3.x < 7.3.11 RCE Vulnerability - Version Check`

ext/standard/var_unserializer.re is prone to a heap use after free while unserializing untrusted data, related to improper use of the hash API for key deletion in a situation with an invalid array size. Exploitation of this issue can have an unspecified impact on the integrity of PHP.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP 7.0.x < 7.0.23, 7.1.x < 7.1.9 Use-After-Free Vulnerability - Linux`

Solution:
Solution type: VendorFix
Update to version 5.6.40, 7.1.16, 7.2.14, 7.3.1 or later.

Affected Software/OS
PHP versions before 5.6.40, 7.x before 7.1.26, 7.2.x before 7.2.14 and 7.3.x before 7.3.1.

Vulnerability Insight
The following flaws exist:
- Fixed bug #77269 (efree() on uninitialized Heap data in imagescale leads to use-after-free). (CVE-2016-10166)
- Fixed bug #77270 (imagecolormatch Out Of Bounds Write on Heap). (CVE-2019-6977)
- Fixed bug #77370 (Buffer overflow on mb regex functions - fetch_token). (CVE-2019-9023)
- Fixed bug #77371 (heap buffer overflow in mb regex functions - compile_string_node). (CVE-2019-9023)
- Fixed bug #77381 (heap buffer overflow in multibyte match_at). (CVE-2019-9023)
- Fixed bug #77382 (heap buffer overflow due to incorrect length in expand_case_fold_string). (CVE-2019-9023)
- Fixed bug #77385 (buffer overflow in fetch_token). (CVE-2019-9023)
- Fixed bug #77394 (Buffer overflow in multibyte case folding - unicode). (CVE-2019-9023)
- Fixed bug #77418 (Heap overflow in utf32be_mbc_to_code). (CVE-2019-9023)
- Fixed bug #77247 (heap buffer overflow in phar_detect_phar_fname_ext). (CVE-2019-9021)
- Fixed bug #77242 (heap out of bounds read in xmlrpc_decode()). (CVE-2019-9020)
- Fixed bug #77380 (Global out of bounds read in xmlrpc base64 code). (CVE-2019-9024)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

. . . continued from previous page . . .

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.17
Fixed version:     7.1.27
Installation
path / port:       8080/tcp
```

Solution:
Solution type: VendorFix
Update to version 7.1.27, 7.2.16, 7.3.3 or later.

Affected Software/OS
PHP version 7.x before 7.1.27, 7.2.x before 7.2.16 and 7.3.x before 7.3.3.

Vulnerability Insight
PHP is prone to multiple vulnerabilities:
- Due to the way rename() across filesystems is implemented, it is possible that file being renamed is briefly available with wrong permissions while the rename is ongoing, thus enabling unauthorized users to access the data. (CVE-2019-9637)
- Uninitialized read in exif_process_IFD_in_MAKERNOTE because of mishandling the maker_note->offset relationship to value_len (CVE-2019-9638)
- Uninitialized read in exif_process_IFD_in_MAKERNOTE because of mishandling the data_len variable (CVE-2019-9639)
- Invalid Read in exif_process_SOFn (CVE-2019-9640)
- Uninitialized read in exif_process_IFD_in_TIFF (CVE-2019-9641)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

```
cpe:/a:php:php:7.0.17
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple denial of service (DoS) vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.17
Fixed version:     None
Installation
path / port:       8080/tcp
```

Solution:

Solution type: WillNotFix

No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
PHP versions through 7.1.5.

Vulnerability Insight
The following flaws exist:
- CVE-2017-8923: The zend_string_extend function in Zend/zend_string.h does not prevent changes to string objects that result in a negative length, which allows remote attackers to cause a denial of service (application crash) or possibly have unspecified other impact by leveraging a script's use of .= with a long string.
- CVE-2017-9119: The i_zval_ptr_dtor function in Zend/zend_variables.h allows attackers to cause a denial of service (memory consumption and application crash) or possibly have unspecified other impact by triggering crafted operations on array data structures.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: Adminer < 4.7.8 SSRF Vulnerability - Linux

Summary
Adminer is prone to a server-side request forgery (SSRF) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 4.2.5
Fixed version:     4.7.8
Installation
path / port:       /
```

Impact
This vulnerability can be used to potentially bypass firewalls to identify internal hosts and perform port scanning of other servers for reconnaissance purposes.

Solution:
Solution type: Mitigation
Update to version 4.7.8 or later.
Note: Version 4.4.0 only partially mitigating this vulnerability for privileged ports (ports in the range of <= 1024) but version 4.7.8 or later is required to fully mitigating this vulnerability for unprivileged ports (in the range of > 1024).

Affected Software/OS
Adminer versions prior to 4.7.8.

Vulnerability Insight
Adminer allows unauthenticated connections to be initiated to arbitrary systems/ports.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Adminer < 4.7.8 SSRF Vulnerability - Linux`
OID:1.3.6.1.4.1.25623.1.0.108532

Critical (CVSS: 9.8)
NVT: PHP < 8.1.32, 8.2.x < 8.2.28 Multiple Vulnerabilities - Linux

Product detection result

```
cpe:/a:php:php:7.0.17
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.17
Fixed version:     8.1.32
Installation
path / port:       8080/tcp
```

Solution:

Solution type: VendorFix

Update to version 8.1.32, 8.2.28 or later.

Affected Software/OS

PHP versions prior to 8.1.32, and 8.2.x prior to 8.2.28.

Vulnerability Insight

The following vulnerabilities exist:

- CVE-2025-1217: Header parser of 'http' stream wrapper does not handle folded headers

. . . continues on next page . . .

. . . continued from previous page . . .

- CVE-2025-1219: libxml streams use wrong 'content-type' header when requesting a redirected resource
- CVE-2025-1734: Streams HTTP wrapper does not fail for headers without colon
- CVE-2025-1736: Stream HTTP wrapper header check might omit basic auth header
- CVE-2025-1861: Stream HTTP wrapper truncate redirect location to 1024 bytes

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `PHP < 8.1.32, 8.2.x < 8.2.28 Multiple Vulnerabilities - Linux`
OID:1.3.6.1.4.1.25623.1.0.154187

Critical (CVSS: 9.8)
NVT: PHP 7.0.0 <= 7.1.15 DoS Vulnerability (Aug 2018) - Linux

Product detection result
`cpe:/a:php:php:7.0.17`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to a denial of service (DoS) vulnerability.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.17
Fixed version:     None
Installation
path / port:       8080/tcp
```

Impact

Successful exploitation will allow attackers to cause a denial of service by performing an integer overflow and therefore crashing the application.

Solution:

Solution type: WillNotFix

No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS

PHP versions 7.x through 7.1.15.

Vulnerability Insight

The flaw exists due to how mysqli_real_escape_string function in mysqli/mysqli_api.c file improperly handles long strings.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `PHP 7.0.0 <= 7.1.15 DoS Vulnerability (Aug 2018) - Linux`

Product detection result

```
cpe:/a:php:php:7.0.17
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary

PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.0.17
Fixed version:     7.0.30
Installation
path / port:       8080/tcp
```

Impact

Successful exploitation will allow an attacker to conduct XSS attacks, crash PHP, conduct denial of service condition and execute arbitrary code in the context of the affected application.

Solution:

Solution type: VendorFix

Update to version 5.6.36, 7.0.30, 7.1.17, 7.2.5 or later.

Affected Software/OS

PHP prior to version 5.6.36, 7.0.x prior to 7.0.30, 7.1.x prior to 7.1.17 and 7.2.x prior to 7.2.5 on Linux.

Vulnerability Insight

The following flaws exist:

- CVE-2018-10549: Out of bounds read error in 'exif_read_data' function while processing crafted JPG data.

- CVE-2018-10546: An error in stream filter 'convert.iconv' which leads to infinite loop on invalid sequence.

. . . continues on next page . . .

. . . continued from previous page . . .

- CVE-2018-10548: An error in the LDAP module of PHP which allows a malicious LDAP server or man-in-the-middle attacker to crash PHP.
- CVE-2018-10547: An error in the 'phar_do_404()' function in 'ext/phar/phar_object.c' script which returns parts of the request unfiltered, leading to another XSS vector. This is due to incomplete fix for CVE-2018-5712.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Detected by nginx Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.113787)

. . . continues on next page . . .

. . . continued from previous page . . .

Summary
The Nginx version on the remote host has reached the End of Life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "Nginx" version on the remote host has reached the end of life.
CPE:                cpe:/a:nginx:nginx:1.10.3
Installed version:  1.10.3
Location/URL:       80/tcp
EOL version:        1.10
EOL date:           2017-04-12
```

Impact
An EOL version of Nginx is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: VendorFix
Update the Nginx version on the remote host to a still supported version.

Vulnerability Detection Method
Checks if an EOL version is present on the target host.
Details: `Nginx End of Life (EOL) Detection`

Detected by nginx Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.113787)
```

Summary
nginx is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Installed version: 1.10.3
Fixed version:     1.13.6
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 1.13.6 or later.

Affected Software/OS
nginx before version 1.13.6.

Vulnerability Insight
The buffer overflow exists for years that exceed four digits, as demonstrated by a file with a modification date in 1969 that causes an integer overflow (or a false modification date far in the future), when encountered by the autoindex module.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `nginx < 1.13.6 Buffer Overflow Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.117471
Version used: `2021-08-17T14:01:00Z`

Product Detection Result
Product: `cpe:/a:f5:nginx:1.10.3`
Method: `nginx Detection Consolidation`
OID: 1.3.6.1.4.1.25623.1.0.113787)

Host scan start	Mon Jan 26 01:48:40 2026 UTC
Host scan end	Mon Jan 26 03:34:11 2026 UTC

Service (Port)	Threat Level
9200/tcp	Critical
9200/tcp	High

2.44.1 Critical 9200/tcp

Critical (CVSS: 10.0)
NVT: Elasticsearch End of Life (EOL) Detection

Summary
The Elasticsearch version on the remote host has reached the End of Life (EOL) and should not be used anymore.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The "Elasticsearch" version on the remote host has reached the end of life.
CPE:               cpe:/a:elastic:elasticsearch:2.4.6
Installed version: 2.4.6
EOL version:       2.4
EOL date:          2018-02-28
```

Impact
An EOL version of Elasticsearch is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: VendorFix
Update Elasticsearch to a version that still receives technical support and updates.

Vulnerability Detection Method
Checks if an EOL version is present on the target host.
Details: `Elasticsearch End of Life (EOL) Detection`
OID:1.3.6.1.4.1.25623.1.0.113131
Version used: `2025-09-03T08:26:15Z`

2.44.2 High 9200/tcp

High (CVSS: 8.8)
NVT: Elastic Elasticsearch 'CVE-2018-3831' Information Disclosure Vulnerability - Linux

Summary
Elasticsearch is prone to an information disclosure vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 2.4.6
Fixed version:     5.6.12
```

Impact
Successful exploitation would allow an authenticated attacker to acquire valid login credentials.

Solution:
Solution type: VendorFix
Update to version 5.6.12 or 6.4.1 respectively.

Affected Software/OS
Elasticsearch versions through 5.6.11 and 6.0.0 through 6.4.0.

Vulnerability Insight
The _cluster/settings API, when queried, could leak sensitive configuration information such as passwords, tokens or usernames.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Elastic Elasticsearch 'CVE-2018-3831' Information Disclosure Vulnerability - Li.`

2.45.1 Critical 80/tcp

Critical (CVSS: 9.9)
NVT: jQuery End of Life (EOL) Detection - Linux

Summary
The jQuery version on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "jQuery" version on the remote host has reached the end of life.
CPE:                cpe:/a:jquery:jquery:2.2.4
Installed version: 2.2.4
Location/URL:       /flasgger_static/lib/jquery.min.js
EOL version:        2
EOL date:           unknown
Detection info (see OID: 1.3.6.1.4.1.25623.1.0.150658 for more info):
- Identified file: http://httpbin.trabalho_vulnnet/flasgger_static/lib/jquery.mi
↪n.js
- Referenced at:   http://httpbin.trabalho_vulnnet/
```

Impact
An EOL version of jQuery is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: VendorFix
Update jQuery on the remote host to a still supported version.

Vulnerability Detection Method
Checks if an EOL version is present on the target host.
Details: `jQuery End of Life (EOL) Detection - Linux`

2.46.1 Critical 6379/tcp

Critical (CVSS: 9.9)
NVT: Redis Multiple Vulnerabilities (Oct 2025, RediShell)

Summary
Redis is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 5.0.14
Fixed version:     6.2.20
```

Solution:
Solution type: VendorFix
Update to version 6.2.20, 7.2.11, 7.4.6, 8.0.4, 8.2.2 or later.

Affected Software/OS
Redis prior to version 6.2.20, 7.2.x prior to 7.2.11, 7.4.x prior to 7.4.6, 8.0.x prior to 8.0.4 and 8.2.x prior to 8.2.2.

Vulnerability Insight
The following flaws exist:
- CVE-2025-46817: Lua library commands may lead to integer overflow and potential remote code execution (RCE)
- CVE-2025-46818: Running Lua function as a different user
- CVE-2025-46819: Out of bound read due to a bug in LUA
- CVE-2025-49844: Lua Use-After-Free may lead to RCE and dubbed 'RediShell'

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Redis Multiple Vulnerabilities (Oct 2025, RediShell)`

High (CVSS: 8.8)
NVT: Redis Stack Overflow Vulnerability (GHSA-p486-xggp-782c)

Summary

Redis is prone to a heap-based stack overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 4.0.14
Fixed version:     5.0.14
```

Solution:
Solution type: VendorFix
Update to version 5.0.14, 6.0.16, 6.2.6 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
Redis version 2.6 and later.

Vulnerability Insight
Specially crafted Lua scripts executing in Redis can cause the heap-based Lua stack to be overflowed, due to incomplete checks for this condition. This can result with heap corruption and potentially remote code execution.

Vulnerability Detection Method
Details: `Redis Stack Overflow Vulnerability (GHSA-p486-xggp-782c)`
OID:1.3.6.1.4.1.25623.1.0.146847
Version used: `2025-10-10T05:39:02Z`

High (CVSS: 8.8)
NVT: Redis 2.6 < 6.2.16, 7.0.0. < 7.2.6, 7.4.0 RCE vulnerability

Summary
Redis is prone to a remote code execution (RCE) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 4.0.14
Fixed version:     6.2.16
```

Solution:
Solution type: VendorFix
Update to version 6.2.16, 7.2.6, 7.4.1 or later.

Affected Software/OS
Redis versions 2.6 through 6.2.15, 7.0.0 through 7.2.5 and 7.4.0.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
Lua library commands may lead to stack overflow and potential remote code execution vulnerability

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Redis 2.6 < 6.2.16, 7.0.0. < 7.2.6, 7.4.0 RCE vulnerability`

High (CVSS: 8.8)
NVT: Redis Integer Overflow Vulnerability (GHSA-hgj8-vff2-7cjf)

Summary
Redis is prone to an integer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 4.0.14
Fixed version:     5.0.11
```

Solution:
Solution type: VendorFix
Update to version 5.0.11, 6.0.11, 6.2 or later.

Affected Software/OS
Redis version 4.0 and later.

Vulnerability Insight
An integer overflow bug in 32-bit Redis could be exploited to corrupt the heap and potentially result with remote code execution.

. . . continues on next page . . .

. . . continued from previous page . . .

Redis 4.0 or newer uses a configurable limit for the maximum supported bulk input size. By default, it is 512MB which is a safe value for all platforms.
If the limit is significantly increased, receiving a large request from a client may trigger several integer overflow scenarios, which would result with buffer overflow and heap corruption. This could in certain conditions be exploited for remote code execution.
By default, authenticated Redis users have access to all configuration parameters and can therefore use the 'CONFIG SET proto-max-bulk-len' to change the safe default, making the system vulnerable.
This problem only affects 32-bit Redis (on a 32-bit system, or as a 32-bit executable running on a 64-bit system).

Vulnerability Detection Method
Details: `Redis Integer Overflow Vulnerability (GHSA-hgj8-vff2-7cjf)`

NVT: jQuery End of Life (EOL) Detection - Linux

Summary
The jQuery version on the remote host has reached the end of life (EOL) and should not be used anymore.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "jQuery" version on the remote host has reached the end of life.
CPE:                cpe:/a:jquery:jquery:1.11.3
Installed version:  1.11.3
Location/URL:       /js/jquery-1.11.3.min.js
EOL version:        1
EOL date:           unknown
Detection info (see OID: 1.3.6.1.4.1.25623.1.0.150658 for more info):
- Identified file: http://gogs011.trabalho_vulnnet:3000/js/jquery-1.11.3.min.js
- Referenced at:   http://gogs011.trabalho_vulnnet:3000/install/
```

Impact

An EOL version of jQuery is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:

Solution type: VendorFix

Update jQuery on the remote host to a still supported version.

Vulnerability Detection Method

Checks if an EOL version is present on the target host.

Details: `jQuery End of Life (EOL) Detection - Linux`

OID:1.3.6.1.4.1.25623.1.0.117149

2.48.2 Critical 22/tcp

Critical (CVSS: 9.8)
NVT: OpenBSD OpenSSH < 9.3p2 RCE Vulnerability

Product detection result

```
cpe:/a:openbsd:openssh:7.4
Detected by OpenSSH Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.108577)
```

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

OpenBSD OpenSSH is prone to a remote code execution (RCE) vulnerability in OpenSSH's forwarded ssh-agent.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.4
Fixed version:     9.3p2
Installation
path / port:       22/tcp
```

Solution:
Solution type: VendorFix
Update to version 9.3p2 or later.

Affected Software/OS
OpenBSD OpenSSH prior to version 9.3p2.
The following conditions needs to be met:
- Exploitation requires the presence of specific libraries on the victim system.
- Remote exploitation requires that the agent was forwarded to an attacker-controlled system.

Vulnerability Insight
A condition where specific libraries loaded via ssh-agent(1)'s PKCS#11 support could be abused to achieve remote code execution via a forwarded agent socket.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `OpenBSD OpenSSH < 9.3p2 RCE Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.104869

NVT: Redis <= 4.0.2 Buffer Overflow Vulnerability

Summary
Redis is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 3.2.12
Fixed version:     4.0.3
```

Impact
A successful exploitation would allow the attacker to corrupt the host's memory or even execute arbitrary commands on the host.

Solution:
Solution type: VendorFix
Update to version 4.0.3 or later.

Affected Software/OS
Redis version 4.0.2 and prior.

Vulnerability Insight
The clusterLoadConfig function within /redis/src/cluster.c allows for a buffer overflow vulnerability leading from an array index being set from user-controllable input.

Vulnerability Detection Method
Checks if a vulnerable version is present on the host.
Details: `Redis <= 4.0.2 Buffer Overflow Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.113011
Version used: `2025-10-10T05:39:02Z`

References

Critical (CVSS: 9.8)
NVT: Redis RCE Vulnerability (GHSA-39h2-x6c4-6w4c)

Summary
Redis is prone to a remote code execution (RCE) vulnerability.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.2.12
Fixed version:     6.2.17
```

Solution:
Solution type: VendorFix
Update to version 6.2.17, 7.2.7, 7.4.2 or later.

Affected Software/OS
Redis prior to version 6.2.17, 7.x prior to 7.2.7 and 7.4.x prior to 7.4.2.

Vulnerability Insight
An authenticated user may use a specially crafted Lua script to manipulate the garbage collector and potentially lead to remote code execution.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Redis RCE Vulnerability (GHSA-39h2-x6c4-6w4c)`
OID:1.3.6.1.4.1.25623.1.0.153718

2.50.2 High 6379/tcp

High (CVSS: 8.8)
NVT: Redis < 5.0.14, 6.0.x < 6.0.16, 6.1.x < 6.2.6 Multiple Vulnerabilities

Summary
Redis is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 3.2.12
Fixed version:     5.0.14
```

Solution:
Solution type: VendorFix
Update to version 5.0.14, 6.0.16, 6.2.6 or later.

Affected Software/OS
Redis prior to version 5.0.14, version 6.0.x through 6.0.15 and 6.1.x through 6.2.5.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2021-32628: Integer overflow in the ziplist data structure
- CVE-2021-32675: Denial of Service (DoS)
- CVE-2021-32687: Integer overflow in intsets
- CVE-2021-32762: Integer overflow in redis-cli and redis-sentinel
- CVE-2021-41099: Integer overflow in the underlying string library

Vulnerability Detection Method
Details: `Redis < 5.0.14, 6.0.x < 6.0.16, 6.1.x < 6.2.6 Multiple Vulnerabilities`

```

High (CVSS: 8.8)
NVT: Redis Stack Overflow Vulnerability (GHSA-p486-xggp-782c)

Summary
Redis is prone to a heap-based stack overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.2.12
Fixed version:     5.0.14
```

Solution:
Solution type: VendorFix
Update to version 5.0.14, 6.0.16, 6.2.6 or later.

Affected Software/OS
Redis version 2.6 and later.

Vulnerability Insight
Specially crafted Lua scripts executing in Redis can cause the heap-based Lua stack to be overflowed, due to incomplete checks for this condition. This can result with heap corruption and potentially remote code execution.

Vulnerability Detection Method
Details: `Redis Stack Overflow Vulnerability (GHSA-p486-xggp-782c)`
OID:1.3.6.1.4.1.25623.1.0.146847
Version used: `2025-10-10T05:39:02Z`

High (CVSS: 8.8)
NVT: Redis 2.6 < 6.2.16, 7.0.0. < 7.2.6, 7.4.0 RCE vulnerability

Summary
Redis is prone to a remote code execution (RCE) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 3.2.12
Fixed version: 6.2.16

Solution:
Solution type: VendorFix
Update to version 6.2.16, 7.2.6, 7.4.1 or later.

Affected Software/OS
Redis versions 2.6 through 6.2.15, 7.0.0 through 7.2.5 and 7.4.0.

Vulnerability Insight
Lua library commands may lead to stack overflow and potential remote code execution vulnerability

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: Redis 2.6 < 6.2.16, 7.0.0. < 7.2.6, 7.4.0 RCE vulnerability
OID:1.3.6.1.4.1.25623.1.0.128055

High (CVSS: 8.8)
NVT: Redis < 6.0.20, 6.2.x < 6.2.13, 7.x < 7.0.12 Heap Overflow Vulnerability

Summary
Redis is prone to a heap overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 3.2.12
Fixed version:     6.0.20
```

Solution:
Solution type: VendorFix
Update to version 6.0.20, 6.2.13, 7.0.12 or later.

Affected Software/OS
Redis prior to version 6.0.20, version 6.2.x through 6.2.12 and 7.x through 7.0.11.

Vulnerability Insight
A specially crafted Lua script executing in Redis can trigger a heap overflow in the cjson and cmsgpack libraries, and result in heap corruption and potentially remote code execution.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Redis < 6.0.20, 6.2.x < 6.2.13, 7.x < 7.0.12 Heap Overflow Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.149921

High (CVSS: 8.4)
NVT: Redis Buffer Overflow Vulnerability

Summary
Redis is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 3.2.12
Fixed version:     4.0.10
Installation
path / port:       /
```

Impact
Successful exploitation will allow an attacker to achieve code execution and escalate to higher privileges via a crafted command line.

Solution:
Solution type: VendorFix
Update to version 4.0.10 or 5.0 RC3 or later. Please see the references for more information.

Affected Software/OS
Redis versions before 4.0.10 and 5.x before 5.0 RC3

Vulnerability Insight
The flaw exists due to a buffer overflow error in redis-cli of Redis.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Redis Buffer Overflow Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.813439

`cpe:/a:squid-cache:squid:3.5.27`
`Detected by Squid Detection (HTTP) (OID: 1.3.6.1.4.1.25623.1.0.900611)`

Summary
Squid is prone to a buffer overflow vulnerability in URN handling.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.5.27
Fixed version:     6.4
Installation
path / port:       3128/tcp
```

Solution:
Solution type: VendorFix
Update to version 6.4 or later.

Affected Software/OS
Squid prior to version 6.4.

Vulnerability Insight
Due to incorrect buffer management Squid is vulnerable to a heap buffer overflow and possible remote code execution attack when processing URN.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Squid Buffer Overflow Vulnerability (GHSA-w4gv-vw3f-29g3, SQUID-2025:1)`
OID:1.3.6.1.4.1.25623.1.0.155085

cpe:/a:squid-cache:squid:3.5.27
Detected by Squid Detection (HTTP) (OID: 1.3.6.1.4.1.25623.1.0.900611)

Summary
Squid is prone to a denial of service vulnerability due to incorrect buffer management when processing HTTP Digest Authentication credentials.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 3.5.27
Fixed version: 4.8

Solution:
Solution type: VendorFix
Update to version 4.8 or later.

Affected Software/OS
Squid versions 3.3.9 - 3.5.28 and 4.x - 4.7.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

Due to incorrect input validation the HTTP Request header parser for Digest authentication may access memory outside the allocated memory buffer.
On systems with memory access protections this can result in the Squid process being terminated unexpectedly. Resulting in a denial of service for all clients using the proxy.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Squid Security Update Advisory SQUID-2018:3`

Critical (CVSS: 9.8)
NVT: Squid 3.5.18 - 3.5.28 / 4.0.10 - 4.7 Multiple Vulnerabilities (SQUID-2019:4)

Product detection result
`cpe:/a:squid-cache:squid:3.5.27`
`Detected by Squid Detection (HTTP) (OID: 1.3.6.1.4.1.25623.1.0.900611)`

Summary
Squid is prone to multiple vulnerabilities.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.5.27
Fixed version:     4.8
Installation
path / port:       3128/tcp
```

Impact

A remote client can:
- deliver crafted URLs to bypass cache manager security controls and retrieve confidential details about the proxy and traffic it is handling.
- deliver crafted URLs which cause arbitrary content from one origin server to be stored in cache as URLs within another origin. This opens a window of opportunity for clients to be tricked into fetching and XSS execution of that content via side channels.

Solution:

Solution type: VendorFix

Update to version 4.8 or later.

Affected Software/OS

Squid proxy 3.5.18 through 3.5.28 and 4.0.10 through 4.7.
Note: All Squid-4.x up to and including 4.7 without HTTPS support are NOT vulnerable.

Vulnerability Insight

Due to incorrect URL handling Squid is vulnerable to access control bypass, cache poisoning and cross-site scripting attacks when processing HTTP Request messages.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.
Details: `Squid 3.5.18 - 3.5.28 / 4.0.10 - 4.7 Multiple Vulnerabilities (SQUID-2019:4)`

NVT: Squid Buffer Overflow Vulnerability (SQUID-2022:2)

Product detection result

. . . continues on next page . . .

. . . continued from previous page . . .

```
cpe:/a:squid-cache:squid:3.5.27
Detected by Squid Detection (HTTP) (OID: 1.3.6.1.4.1.25623.1.0.900611)
```

Summary
Squid is prone to a buffer overflow vulnerability in SSPI and SMB authentication.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.5.27
Fixed version:     5.7
Installation
path / port:       3128/tcp
```

Impact
This problem allows a remote client to perform a denial of service attack when Squid is configured to use NTLM or Negotiate authentication with one of the vulnerable helpers.
This problem allows a remote client to extract sensitive information from machine memory when Squid is configured to use NTLM or Negotiate authentication with one of the vulnerable helpers. The scope of this information includes user credentials in decrypted forms, and also arbitrary memory areas beyond Squid and the helper itself.
This attack is limited to authentication helpers built using the libntlmauth library shipped by Squid.

Solution:
Solution type: VendorFix
Update to version 5.7 or later.

Affected Software/OS
Squid version 2.5.STABLE1 through 2.7.STABLE9, 3.x through 3.5.28, 4.x through 4.17 and 5.x through 5.6.

Vulnerability Insight
Due to an incorrect integer overflow protection Squid SSPI and SMB authentication helpers are vulnerable to a buffer overflow attack.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Squid Buffer Overflow Vulnerability (SQUID-2022:2)`

Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.30
Installation
path / port:       80/tcp
```

Impact

. . . continues on next page . . .

. . . continued from previous page . . .

Successful exploitation will allow an attacker to replay HTTP requests across servers without detection, influence the user content, upload a malicious file, crash the Apache HTTP Server and perform denial of service attack.

Solution:
Solution type: VendorFix
Update to version 2.4.30 or later. Please see the references for more information.

Affected Software/OS
Apache HTTP Server versions from 2.4.1 to 2.4.4, 2.4.6, 2.4.7, 2.4.9, 2.4.10, 2.4.12, 2.4.16 to 2.4.18, 2.4.20, 2.4.23, 2.4.25 to 2.4.29.

Vulnerability Insight
Multiple flaws exist due to:
- Apache HTTP Server fails to correctly generate the nonce sent to prevent reply attacks.
- Misconfigured mod_session variable, HTTP_SESSION.
- Apache HTTP Server fails to sanitize the expression specified in '<FilesMatch>'.
- An error in Apache HTTP Server 'mod_authnz_ldap' when configured with AuthLDAPCharsetConfig.
- Apache HTTP Server fails to sanitize against a specially crafted request.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server Multiple Vulnerabilities (Apr 2018) - Linux`

cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.48
Installation
path / port:       80/tcp
```

Impact

- CVE-2020-35452: A specially crafted Digest nonce can cause a stack overflow in mod_auth_digest.
- CVE-2021-26690: A specially crafted Cookie header handled by mod_session can cause a NULL pointer dereference and crash, leading to a possible Denial Of Service.
- CVE-2021-26691: A specially crafted SessionHeader sent by an origin server could cause a heap overflow.

Solution:

Solution type: VendorFix

Update to version 2.4.48 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
Apache HTTP Server versions 2.4.0 to 2.4.46 on Linux.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2020-35452: mod_auth_digest possible stack overflow by one null byte
- CVE-2021-26690: mod_session NULL pointer dereference
- CVE-2021-26691: mod_session response handling heap overflow

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.26
Installation
path / port:       80/tcp
```

Impact

Successful exploitation will allow remote attackers to bypass authentication and perform unauthorized actions, cause a denial-of-service condition and gain access to potentially sensitive information.

Solution:

Solution type: VendorFix

Update to Apache HTTP Server 2.2.33 or 2.4.26 or later.

Affected Software/OS

Apache HTTP Server 2.2.x before 2.2.33 and 2.4.x before 2.4.26.

Vulnerability Insight

Multiple flaws exist as,

- The mod_mime can read one byte past the end of a buffer when sending a malicious Content-Type response header.

- The mod_ssl may dereference a NULL pointer when third-party modules call ap_hook_process_connection() during an HTTP request to an HTTPS port.

. . . continues on next page . . .

. . . continued from previous page . . .

- An use of the ap_get_basic_auth_pw() by third-party modules outside of the authentication phase may lead to authentication requirements being bypassed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.8)
NVT: Apache HTTP Server < 2.4.60 Multiple Vulnerabilities - Linux

Product detection result
`cpe:/a:apache:http_server:2.4.25`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.60
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.60 or later.

Affected Software/OS
Apache HTTP Server version 2.4.59 and prior.

Vulnerability Insight
The following flaws exist:
- CVE-2024-36387: Denial of Service (DoS) by Null pointer in websocket over HTTP/2
- CVE-2024-38473: Proxy encoding problem
- CVE-2024-38474: Weakness with encoded question marks in backreferences
- CVE-2024-38475: Weakness in mod_rewrite when first segment of substitution matches filesystem path
- CVE-2024-38476: May use exploitable/malicious backend application output to run local handlers via internal redirect
- CVE-2024-38477: Crash resulting in DoS in mod_proxy via a malicious request
- CVE-2024-39573: mod_rewrite proxy handler substitution

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server < 2.4.60 Multiple Vulnerabilities - Linux`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

Installed version:	2.4.25
Fixed version:	2.4.54
Installation path / port:	80/tcp

Solution:
Solution type: VendorFix
Update to version 2.4.54 or later.

Affected Software/OS
Apache HTTP Server version 2.4.53 and prior.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2022-26377: mod_proxy_ajp: Possible request smuggling
- CVE-2022-28614: Read beyond bounds via ap_rwrite()
- CVE-2022-28615: Read beyond bounds in ap_strcmp_match()
- CVE-2022-29404: Denial of service in mod_lua r:parsebody
- CVE-2022-30556: Information disclosure in mod_lua with websockets
- CVE-2022-31813: mod_proxy X-Forwarded-For dropped by hop-by-hop mechanism

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux

Product detection result

cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

Apache HTTP Server is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.52
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.52 or later.

Affected Software/OS
Apache HTTP Server versions through 2.4.51.

Vulnerability Insight
A carefully crafted request body can cause a buffer overflow in the mod_lua multipart parser (r:parsebody() called from Lua scripts).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Apache HTTP Server 2.4.0 - 2.4.55 HTTP Request Smuggling Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.25
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a HTTP request smuggling vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.56
Installation
path / port:       80/tcp
```

Impact

Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

Solution:

Solution type: VendorFix

Update to version 2.4.56 or later.

Affected Software/OS

Apache HTTP Server versions 2.4.0 through 2.4.55.

Vulnerability Insight

Some mod_proxy configurations allow a HTTP Request Smuggling attack.
Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.41
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.41 or later.

Affected Software/OS
Apache HTTP Server version 2.4.18 to 2.4.39.

Vulnerability Insight
Using fuzzed network input, the http/2 session handling could be made to read memory after being freed during connection shutdown.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server Memory Access Vulnerability - Linux`

Product detection result
`cpe:/a:apache:http_server:2.4.25`
`Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1`
`↪.0.117232)`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.27
Installation
path / port:       80/tcp
```

Impact
Successful exploitation will allow remote attackers to cause the target service to crash. A remote user can obtain potentially sensitive information as well on the target system.

Solution:
Solution type: VendorFix
Update to Apache HTTP Server 2.2.34 or 2.4.27 or later.

Affected Software/OS
Apache HTTP Server 2.2.x before 2.2.34 and 2.4.x before 2.4.27.

Vulnerability Insight
The flaw exists due to error in Apache 'mod_auth_digest' which does not properly initialize memory used to process 'Digest' type HTTP Authorization headers.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 'mod_auth_digest' Multiple Vulnerabilities - Linux`

Summary
Apache HTTP Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.25
Fixed version:     2.4.55
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.55 or later.

Affected Software/OS
Apache HTTP Server version 2.4.54 and prior.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2006-20001: mod_dav out of bounds read, or write of zero byte
- CVE-2022-36760: Possible request smuggling in mod_proxy_ajp
- CVE-2022-37436: mod_proxy allows a backend to trigger HTTP response splitting

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Grafana Authentication Bypass Vulnerability

Summary
Grafana is prone to an Authentication Bypass vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
```
Installed version: 5.1.0
Fixed version:     5.2.3
```

Impact
Knowing only the username, an attacker can get access with the privilege level of any user.

Solution:
Solution type: VendorFix
Update to version 4.6.4 and 5.2.3 respectively.

Affected Software/OS
Grafana 2.0.0 through 4.6.3 and 5.0.0 through 5.2.2.

Vulnerability Insight
An attacker can generate a valid remember me cookie knowing only a username of an LDAP or OAuth user.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Grafana Authentication Bypass Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.113260
Version used: `2023-07-20T05:05:17Z`

NVT: Grafana CSRF Vulnerability (GHSA-cmf4-h3xc-jw8w)

Summary
Grafana is prone to a cross-site request forgery (CSRF) vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
Installed version: 5.1.0
Fixed version:     7.5.15
Installation
path / port:       /
```

Solution:
Solution type: VendorFix
Update to version 7.5.15, 8.3.5 or later.

Affected Software/OS
Grafana version 3.0-beta1 through 7.5.14 and 8.x through 8.3.4.

Vulnerability Detection Method
An attacker can exploit this vulnerability for privilege escalation by tricking an authenticated user into inviting the attacker as a new user with high privileges.
Details: `Grafana CSRF Vulnerability (GHSA-cmf4-h3xc-jw8w)`
OID:1.3.6.1.4.1.25623.1.0.147617
Version used: `2022-05-02T03:04:50Z`

NVT: Grafana 3.0.1 < 6.7.4, 7.0 < 7.0.2 SSRF Vulnerability

Summary
Grafana is prone to a server-side request forgery (SSRF) vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
Installed version: 5.1.0
Fixed version:     6.7.4
Installation
path / port:       /
```

Solution:
Solution type: VendorFix
Update to version 6.7.4, 7.0.2 or later.

Affected Software/OS
Grafana versions 3.0.1 - 7.0.1.

Vulnerability Insight
The avatar feature in Grafana has an SSRF Incorrect Access Control issue. This vulnerability allows any unauthenticated user/client to make Grafana send HTTP requests to any URL and return its result to the user/client. This can be used to gain information about the network that Grafana is running on.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: Grafana 3.0.1 < 6.7.4, 7.0 < 7.0.2 SSRF Vulnerability

NVT: SSH Brute Force Logins With Default Credentials Reporting

Summary
It was possible to login into the remote SSH server using default credentials.

Quality of Detection (QoD): 95%

Vulnerability Detection Result
```
It was possible to login with the following credentials <User>:<Password>
root:root
```

Impact
This issue may be exploited by a remote attacker to e.g. gain access to sensitive information or modify system configuration.

Solution:
Solution type: Mitigation
Change the password as soon as possible.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
The following products are known to use the default credentials checked by the VT 'SSH Brute Force Logins With Default Credentials' (OID: 1.3.6.1.4.1.25623.1.0.108013) used for this reporting:
- CVE-2017-16523: MitraStar GPT-2541GNAC (HGU) 1.00(VNJ0)b1 and DSL-100HN-T1 ES_113WJY0b16 devices
- CVE-2017-20214: FLIR Thermal Camera F/FC/PT/D
- CVE-2018-25138: FLIR AX8 Thermal Camera
- CVE-2018-25147: Microhard Systems IPn4G
- CVE-2019-25241: FaceSentry Access Control System
- CVE-2019-25291: INIM Electronics Smartliving SmartLAN/G/SI
- CVE-2020-29583: Zyxel Firewall / AP Controller
- CVE-2020-36915: Adtec Digital SignEdje Digital Signage Player
- CVE-2020-9473: S. Siedle & Soehne SG 150-0 Smart Gateway before 1.2.4
- CVE-2021-27797: Brocade Fabric OS
- CVE-2021-47744: Cypress Solutions CTM-200/CTM-ONE
- CVE-2023-1944: minikube 1.29.0 and probably prior
- CVE-2023-53983: Anevia Flamingo XL/XS
- CVE-2024-22902: Vinchin Backup & Recovery
- CVE-2024-31970: AdTran SRG 834-5 HDC17600021F1 devices (with SmartOS 11.1.1.1) during a window of time when the device is being set up
- CVE-2024-46328: VONETS VAP11G-300 v3.3.23.6.9
- CVE-2025-12592: Legacy Vivotek devices
- CVE-2025-68718: KAYSUS KS-WR1200
- Various additional products like e.g. Ubiquiti EdgeMax / EdgeRouter, Crestron AM-100 and similar for which no CVE was assigned (See 'default_credentials.inc' file on the file system for a full list)
Other products might be affected as well.

Vulnerability Insight
As the VT 'SSH Brute Force Logins With Default Credentials' (OID: 1.3.6.1.4.1.25623.1.0.108013) might run into a timeout the actual reporting of this vulnerability takes place in this VT instead.

Vulnerability Detection Method
Reports default credentials detected by the VT 'SSH Brute Force Logins With Default Credentials' (OID: 1.3.6.1.4.1.25623.1.0.108013).
Details: `SSH Brute Force Logins With Default Credentials Reporting`

NVT: OpenSSH < 7.2 X11 Forwarding Security Bypass Vulnerability - Linux

Product detection result

```
cpe:/a:openbsd:openssh:6.6.1p1
Detected by OpenSSH Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.108577)
```

Summary

OpenSSH is prone to a security bypass vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 6.6.1p1
Fixed version:     7.2
Installation
path / port:       22/tcp
```

. . . continues on next page . . .

. . . continued from previous page . . .

Impact
Successfully exploiting this issue allows local users to bypass certain security restrictions and perform unauthorized actions. This may lead to further attacks.

Solution:
Solution type: VendorFix
Update to version 7.2 or later.

Affected Software/OS
OpenSSH versions before 7.2 on Linux.

Vulnerability Insight
An access flaw was discovered in OpenSSH, it did not correctly handle failures to generate authentication cookies for untrusted X11 forwarding. A malicious or compromised remote X application could possibly use this flaw to establish a trusted connection to the local X server, even if only untrusted X11 forwarding was requested.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: OpenBSD OpenSSH < 9.3p2 RCE Vulnerability

Product detection result

```
cpe:/a:openbsd:openssh:6.6.1p1
Detected by OpenSSH Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.108577)
```

Summary

OpenBSD OpenSSH is prone to a remote code execution (RCE) vulnerability in OpenSSH's forwarded ssh-agent.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 6.6.1p1
Fixed version:     9.3p2
Installation
path / port:       22/tcp
```

Solution:

Solution type: VendorFix

Update to version 9.3p2 or later.

Affected Software/OS

OpenBSD OpenSSH prior to version 9.3p2.

The following conditions needs to be met:

- Exploitation requires the presence of specific libraries on the victim system.
- Remote exploitation requires that the agent was forwarded to an attacker-controlled system.

Vulnerability Insight

A condition where specific libraries loaded via ssh-agent(1)'s PKCS#11 support could be abused to achieve remote code execution via a forwarded agent socket.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `OpenBSD OpenSSH < 9.3p2 RCE Vulnerability`

2.54.2 High 22/tcp

High (CVSS: 8.5)
NVT: OpenSSH Multiple Vulnerabilities

Product detection result
cpe:/a:openbsd:openssh:6.6.1p1
Detected by OpenSSH Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.108577)

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

OpenSSH is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 6.6.1p1
Fixed version:     7.0
Installation
path / port:       22/tcp
```

Impact

Successful exploitation will allow an attacker to gain privileges, to conduct impersonation attacks, to conduct brute-force attacks or cause a denial of service.

Solution:

Solution type: VendorFix

Upgrade to OpenSSH 7.0 or later.

Affected Software/OS

OpenSSH versions before 7.0.

Vulnerability Insight

Multiple flaws are due to:

- Use-after-free vulnerability in the 'mm_answer_pam_free_ctx' function in monitor.c in sshd.
- Vulnerability in 'kbdint_next_device' function in auth2-chall.c in sshd.
- Vulnerability in the handler for the MONITOR_REQ_PAM_FREE_CTX request.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `OpenSSH Multiple Vulnerabilities`

OID:1.3.6.1.4.1.25623.1.0.806052

Version used: `2023-07-25T05:05:58Z`

NVT: PHP < 8.1.32, 8.2.x < 8.2.28 Multiple Vulnerabilities - Linux

Product detection result
`cpe:/a:php:php:8.1.31`
`Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)`

Summary
PHP is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.1.31
Fixed version:     8.1.32
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.1.32, 8.2.28 or later.

Affected Software/OS
PHP versions prior to 8.1.32, and 8.2.x prior to 8.2.28.

Vulnerability Insight
The following vulnerabilities exist:
- CVE-2025-1217: Header parser of 'http' stream wrapper does not handle folded headers
- CVE-2025-1219: libxml streams use wrong 'content-type' header when requesting a redirected resource
- CVE-2025-1734: Streams HTTP wrapper does not fail for headers without colon
- CVE-2025-1736: Stream HTTP wrapper header check might omit basic auth header
- CVE-2025-1861: Stream HTTP wrapper truncate redirect location to 1024 bytes

Critical (CVSS: 9.8)
NVT: Apache CouchDB 1.x < 1.7.0, 2.x < 2.1.1 Multiple Vulnerabilities - Linux

Summary
Apache CouchDB is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 1.6.1
Fixed version:     1.7.0
Installation
path / port:       /
```

Impact
These vulnerabilities can be used to give non-admin users access to arbitrary shell commands on the server as the database system user.

Solution:
Solution type: VendorFix
Update to version 1.7.0, 2.1.1 or later.

Affected Software/OS
Apache CouchDB version 1.x prior to 1.7.0 and 2.x prior to 2.1.1.

Vulnerability Insight
The vulnerabilities are due to differences in the Erlang-based JSON parser and JavaScript-based JSON parser.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache CouchDB 1.x < 1.7.0, 2.x < 2.1.1 Multiple Vulnerabilities - Linux`
OID:1.3.6.1.4.1.25623.1.0.107258

NVT: Apache CouchDB < 3.2.2 Privilege Escalation Vulnerability - Linux - Version Check

Summary
Apache CouchDB is prone to a privilege escalation vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 1.6.1
Fixed version:     3.2.2
Installation
path / port:       /
```

Solution:
Solution type: VendorFix
Update to version 3.2.2 or later.

Affected Software/OS
Apache CouchDB version 3.2.1 and prior.

Vulnerability Insight
An attacker can access an improperly secured default installation without authenticating and gain admin privileges. The CouchDB documentation has always made recommendations for properly securing an installation, including recommending using a firewall in front of all CouchDB installations.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Apache HTTP Server is prone to a buffer overflow vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

Installed version:	2.4.49
Fixed version:	2.4.52
Installation path / port:	80/tcp

Solution:
Solution type: VendorFix
Update to version 2.4.52 or later.

Affected Software/OS
Apache HTTP Server versions through 2.4.51.

Vulnerability Insight
A carefully crafted request body can cause a buffer overflow in the mod_lua multipart parser (r:parsebody() called from Lua scripts).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: Apache HTTP Server <= 2.4.51 Buffer Overflow Vulnerability - Linux

Product detection result

```
cpe:/a:apache:http_server:2.4.49
Detected by Apache HTTP Server Detection Consolidation (OID: 1.3.6.1.4.1.25623.1
↪.0.117232)
```

Summary

Apache HTTP Server is prone to a HTTP request smuggling vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.49
Fixed version:     2.4.56
Installation
path / port:       80/tcp
```

Impact

Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

Solution:

Solution type: VendorFix

Update to version 2.4.56 or later.

Affected Software/OS

Apache HTTP Server versions 2.4.0 through 2.4.55.

Vulnerability Insight

Some mod_proxy configurations allow a HTTP Request Smuggling attack.

. . . continues on next page . . .

. . . continued from previous page . . .

Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

. . . continues on next page . . .

. . . continued from previous page . . .

↪.0.117232)

Summary
Apache HTTP Server is prone to a directory traversal and a possible remote code execution (RCE) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.4.49
Fixed version:     2.4.51
Installation
path / port:       80/tcp
```

Solution:
Solution type: VendorFix
Update to version 2.4.51 or later.

Affected Software/OS
Apache HTTP Server version 2.4.49 through 2.4.50.

Vulnerability Insight
It was found that the fix for CVE-2021-41773 in Apache HTTP Server 2.4.50 was insufficient. An attacker could use a path traversal attack to map URLs to files outside the directories configured by Alias-like directives.
If files outside of these directories are not protected by the usual default configuration 'require all denied', these requests can succeed. If CGI scripts are also enabled for these aliased paths, this could allow for remote code execution.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Apache HTTP Server 2.4.49 - 2.4.50 Directory Traversal / RCE Vulnerability - Li.`

Summary
It was possible to login into the remote MySQL using default credentials.

Quality of Detection (QoD): 95%

Vulnerability Detection Result
`It was possible to login as user "root" with password "root".`

Solution:
Solution type: Mitigation
- Change the password as soon as possible
- Contact the vendor for other possible fixes / updates

Affected Software/OS
The following products are know to use such weak credentials:
- CVE-2001-0645: Symantec/AXENT NetProwler 3.5.x
- CVE-2002-1809: Windows binary release of MySQL 3.23.2 through 3.23.52
- CVE-2004-1532: AppServ 2.5.x and earlier
- CVE-2004-2357: Proofpoint Protection Server
- CVE-2006-1451: MySQL Manager in Apple Mac OS X 10.3.9 and 10.4.6

cpe:/a:mysql:mysql:5.5.62
Detected by MariaDB / Oracle MySQL Detection (MySQL Protocol) (OID: 1.3.6.1.4.1.
↪25623.1.0.100152)
```

Summary

Oracle MySQL Server is prone to a vulnerability in InnoDB (zlib).

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.5.62
Fixed version:     5.7.42
Installation
path / port:       3306/tcp
```

Solution:

Solution type: VendorFix

Update to version 5.7.42, 8.0.32 or later.

Affected Software/OS

Oracle MySQL Server version 5.7.41 and prior and 8.x through 8.0.31.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Details: `Oracle MySQL Server <= 5.7.41, 8.x <= 8.0.31 Security Update (cpuapr2023) - Lin.`

Critical (CVSS: 9.8)
NVT: Jenkins < 2.154 and < 2.138.4 LTS Multiple Vulnerabilities - Linux

Summary
Jenkins is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 2.150
Fixed version:     2.154
Installation
path / port:       /
```

Solution:
Solution type: VendorFix
Upgrade to Jenkins weekly to 2.154 or later / Jenkins LTS to either 2.138.4 or 2.150.1 or later.

Affected Software/OS
Jenkins LTS up to and including 2.138.3, Jenkins weekly up to and including 2.153.

Vulnerability Insight
Jenkins is prone to the following vulnerabilities:
- Code execution through crafted URLs (CVE-2018-1000861).
- Forced migration of user records (CVE-2018-1000863).
- Workspace browser allowed accessing files outside the workspace (CVE-2018-1000862).
- Potential denial of service through cron expression form validation (CVE-2018-1000864).

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

```

Critical (CVSS: 9.4)
NVT: Jenkins < 2.243, < 2.235.5 LTS Buffer Corruption in bundled Jetty - Linux

Summary
Jenkins is prone to a buffer corruption in bundled Jetty.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 2.150
Fixed version:     2.243
Installation
path / port:       /
```

Impact
This vulnerability may allow unauthenticated attackers to obtain HTTP response headers that may include sensitive data intended for another user.

Solution:

. . . continues on next page . . .

. . . continued from previous page . . .

Solution type: VendorFix
Update to version 2.243, 2.235.5 LTS or later.

Affected Software/OS
Jenkins version 2.242 and prior and 2.235.4 LTS and prior.

Vulnerability Insight
In Eclipse Jetty in case of too large response headers, Jetty throws an exception to produce an HTTP 431 error. When this happens, the ByteBuffer containing the HTTP response headers is released back to the ByteBufferPool twice. Because of this double release, two threads can acquire the same ByteBuffer from the pool and while thread1 is about to use the ByteBuffer to write response1 data, thread2 fills the ByteBuffer with response2 data. Thread1 then proceeds to write the buffer that now contains response2 data.
This results in client1, which issued request1 and expects responses, to see response2 which could contain sensitive data belonging to client2 (HTTP session ids, authentication credentials, etc.).

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Jenkins < 2.243, < 2.235.5 LTS Buffer Corruption in bundled Jetty - Linux`
OID:1.3.6.1.4.1.25623.1.0.112811

High (CVSS: 8.8)
NVT: Jenkins < 2.192 and < 2.176.3 LTS Multiple Vulnerabilities - Linux

Summary
Jenkins is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 2.150
Fixed version:     2.192
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
Installation
path / port:        /
```

Solution:
Solution type: VendorFix
Update to version 2.176.3 LTS, 2.192 weekly or later.

Affected Software/OS
Jenkins weekly up to and including 2.191 and Jenkins LTS up to and including 2.176.2

Vulnerability Insight
Jenkins is prone to multiple vulnerabilities:
- Stored XSS vulnerability in update center (CVE-2019-10383)
- CSRF protection tokens for anonymous users does not expire in some circumstances (CVE-2019-10384)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Jenkins < 2.192 and < 2.176.3 LTS Multiple Vulnerabilities - Linux`

```

High (CVSS: 8.6)
NVT: Jenkins < 2.214, < 2.204.2 LTS Authentication Bypass Vulnerability - Linux

Summary
Jenkins is prone to an inbound TCP Agent Protocol/3 authentication bypass vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 2.150
Fixed version:     2.214
Installation
path / port:        /
```

Solution:
Solution type: VendorFix

. . . continues on next page . . .

. . . continued from previous page . . .

Update to version 2.214, 2.204.2 LTS or later.

Affected Software/OS
Jenkins version 2.213 and prior and 2.204.1 LTS and prior.

Vulnerability Insight
Jenkins includes support for the Inbound TCP Agent Protocol/3 for communication between master and agents. While this protocol has been deprecated in 2018 and was recently removed from Jenkins in 2.214, it could still easily be enabled in Jenkins LTS 2.204.1, 2.213, and older. This protocol incorrectly reuses encryption parameters which allow an unauthenticated remote attacker to determine the connection secret. This secret can then be used to connect attacker-controlled Jenkins agents to the Jenkins master.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Jenkins < 2.214, < 2.204.2 LTS Authentication Bypass Vulnerability - Linux`

```

Summary

It was possible to login into the remote MySQL using default credentials.

Quality of Detection (QoD): 95%

Vulnerability Detection Result

```
It was possible to login as user "root" with password "root".
```

Solution:

Solution type: Mitigation

- Change the password as soon as possible
- Contact the vendor for other possible fixes / updates

Affected Software/OS

The following products are know to use such weak credentials:

- CVE-2001-0645: Symantec/AXENT NetProwler 3.5.x
- CVE-2002-1809: Windows binary release of MySQL 3.23.2 through 3.23.52
- CVE-2004-1532: AppServ 2.5.x and earlier

. . . continues on next page . . .

. . . continued from previous page . . .

- CVE-2004-2357: Proofpoint Protection Server
- CVE-2006-1451: MySQL Manager in Apple Mac OS X 10.3.9 and 10.4.6
- CVE-2007-2554: Associated Press (AP) Newspower 4.0.1 and earlier
- CVE-2007-6081: AdventNet EventLog Analyzer build 4030
- CVE-2009-0919: XAMPP
- CVE-2014-3419: Infoblox NetMRI before 6.8.5
- CVE-2015-4669: Xsuite 2.x
- CVE-2016-6531, CVE-2018-15719: Open Dental before version 18.4
- CVE-2024-22901: Vinchin Backup & Recovery 7.2 and prior

Other products might be affected as well.

Detected by MariaDB / Oracle MySQL Detection (MySQL Protocol) (OID: 1.3.6.1.4.1.
↪25623.1.0.100152)

Summary
Oracle MySQL Server is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 5.6.51
Fixed version:     5.7.44
Installation
path / port:       3306/tcp
```

Solution:
Solution type: VendorFix
Update to version 5.7.44, 8.0.35, 8.1.1 or later.

Affected Software/OS
Oracle MySQL Server version 5.7.43 and prior, 8.x through 8.0.34 and 8.1.0.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: Oracle MySQL Server <= 5.7.43, 8.x <= 8.0.34, 8.1.0 Security Update (cpuoct2023.

NVT: MySQL / MariaDB Default Credentials (MySQL Protocol)

Product detection result
`cpe:/a:mysql:mysql:5.5.62`
`Detected by MariaDB / Oracle MySQL Detection (MySQL Protocol) (OID: 1.3.6.1.4.1.`
`↪25623.1.0.100152)`

Summary
It was possible to login into the remote MySQL using default credentials.

Quality of Detection (QoD): 95%

Vulnerability Detection Result
`It was possible to login as user "root" with password "root".`

Solution:
Solution type: Mitigation
- Change the password as soon as possible
- Contact the vendor for other possible fixes / updates

Affected Software/OS
The following products are know to use such weak credentials:
- CVE-2001-0645: Symantec/AXENT NetProwler 3.5.x
- CVE-2002-1809: Windows binary release of MySQL 3.23.2 through 3.23.52
- CVE-2004-1532: AppServ 2.5.x and earlier
- CVE-2004-2357: Proofpoint Protection Server
- CVE-2006-1451: MySQL Manager in Apple Mac OS X 10.3.9 and 10.4.6
- CVE-2007-2554: Associated Press (AP) Newspower 4.0.1 and earlier
- CVE-2007-6081: AdventNet EventLog Analyzer build 4030
- CVE-2009-0919: XAMPP
- CVE-2014-3419: Infoblox NetMRI before 6.8.5
- CVE-2015-4669: Xsuite 2.x
- CVE-2016-6531, CVE-2018-15719: Open Dental before version 18.4
- CVE-2024-22901: Vinchin Backup & Recovery 7.2 and prior

Other products might be affected as well.

Critical (CVSS: 9.8)
NVT: MongoDB Certificate Validation Vulnerability (SERVER-72839) - Linux

Summary
MongoDB is prone to a certificate validation vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.6.23
Fixed version:     4.4.29
```

Solution:
Solution type: VendorFix
Update to version 4.4.29, 5.0.25, 6.0.14, 7.0.6 or later.

Affected Software/OS
MongoDB version 3.2.6 through 4.4.28, 5.x through 5.0.24, 5.1.x through 6.0.13 and 6.1.x through 7.0.5.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

Under certain configurations of –tlsCAFile and tls.CAFile, MongoDB Server may skip peer certificate validation which may result in untrusted connections to succeed. This may effectively reduce the security guarantees provided by TLS and open connections that should have been closed due to failing certificate validation.
Required Configuration: A server process will allow incoming connections to skip peer certificate validation if the server process was started with TLS enabled (net.tls.mode set to allowTLS, preferTLS, or requireTLS) and without a net.tls.CAFile configured.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `MongoDB Certificate Validation Vulnerability (SERVER-72839) - Linux`
OID:1.3.6.1.4.1.25623.1.0.151888

. . . continued from previous page . . .

Summary
Squid is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 3.3.8
Fixed version:     4.11
```

Solution:
Solution type: VendorFix
Update to version 4.11, 5.0.2 or later.

Affected Software/OS
Squid versions 3.x through 3.5.28, 4.x through 4.10 and 5.x through 5.0.1.

Vulnerability Insight
The following flaws exist:
- CVE-2019-12519: Stack based buffer overflow vulnerability
- CVE-2019-12521: Heap buffer overflow vulnerability

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Squid Security Update Advisory (SQUID-2019:12)`

NVT: Squid Buffer Overflow Vulnerability (GHSA-w4gv-vw3f-29g3, SQUID-2025:1)

Product detection result
`cpe:/a:squid-cache:squid:3.3.8`
`Detected by Squid Detection (HTTP) (OID: 1.3.6.1.4.1.25623.1.0.900611)`

Summary
Squid is prone to a buffer overflow vulnerability in URN handling.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.3.8
Fixed version:     6.4
Installation
path / port:       3128/tcp
```

Solution:
Solution type: VendorFix
Update to version 6.4 or later.

Affected Software/OS
Squid prior to version 6.4.

Vulnerability Insight
Due to incorrect buffer management Squid is vulnerable to a heap buffer overflow and possible remote code execution attack when processing URN.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Squid Buffer Overflow Vulnerability (GHSA-w4gv-vw3f-29g3, SQUID-2025:1)`

. . . continues on next page . . .

. . . continued from previous page . . .

Product detection result
`cpe:/a:squid-cache:squid:3.3.8`
`Detected by Squid Detection (HTTP) (OID: 1.3.6.1.4.1.25623.1.0.900611)`

Summary
Squid is prone to multiple vulnerabilities in the HTTP Digest authentication.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 3.3.8
Fixed version:     4.11
```

Solution:
Solution type: VendorFix
Update to version 4.11, 5.0.2 or later.

Affected Software/OS
Squid versions 2.x, 3.x through 3.5.28, 4.x through 4.10 and 5.x through 5.0.1.

Vulnerability Insight
Due to an integer overflow bug Squid is vulnerable to credential replay and remote code execution attacks against HTTP Digest Authentication tokens.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Squid Security Update Advisory (SQUID-2020:4)`

High (CVSS: 8.8)
NVT: Squid Multiple Vulnerabilities (SQUID-2016:5, SQUID-2016:6) - Linux

Product detection result

```
cpe:/a:squid-cache:squid:3.3.8
Detected by Squid Detection (HTTP) (OID: 1.3.6.1.4.1.25623.1.0.900611)
```

Summary

Squid is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.3.8
Fixed version:     3.5.17
```

Impact

Successful exploitation will allow remote attackers to cause a denial of service, execute arbitrary code, or obtain sensitive stack layout information.

Solution:

Solution type: VendorFix

Update to version 3.5.17, 4.0.9 or later.

Affected Software/OS

Squid version 3.x before 3.5.17 and 4.x before 4.0.9.

Vulnerability Insight

Multiple flaws exist due to:
- A buffer overflow in the cachemgr.cgi tool.
- Multiple on-stack buffer overflow from incorrect bounds calculation in Squid ESI processing.

Vulnerability Detection Result
Installed version: 3.3.8
Fixed version: 4.12

Solution:
Solution type: VendorFix
Update to version 4.12, 5.0.3 or later.

Affected Software/OS
Squid versions 2.0 through 2.STABLE9, 3.0 through 3.5.28, 4.0 through 4.11 and 5.0.1 through 5.0.2.

Vulnerability Insight
Due to incorrect input validation Squid is vulnerable to a Request Smuggling and Poisoning attack against the HTTP cache.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: Squid Security Update Advisory (SQUID-2020:7)
OID:1.3.6.1.4.1.25623.1.0.144212

High (CVSS: 8.6)
NVT: Squid Poisoning Vulnerability (SQUID-2016:8) - Linux

Product detection result
`cpe:/a:squid-cache:squid:3.3.8`
`Detected by Squid Detection (HTTP) (OID: 1.3.6.1.4.1.25623.1.0.900611)`

Summary
Squid is prone to a cache poisoning vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 3.3.8
Fixed version:     3.5.18
```

Impact
Successful exploitation will allow remote attackers to cause cache poisoning and to bypass of same-origin security policy.

Solution:
Solution type: VendorFix
Update to version 3.5.18 or later.

Affected Software/OS
Squid version prior to 3.5.18.

Vulnerability Insight
The flaw exists due to an incorrect input validation in HTTP Request processing.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Squid Poisoning Vulnerability (SQUID-2016:8) - Linux`

NVT: Squid Poisoning Vulnerability (SQUID-2016:7) - Linux

Product detection result

```
cpe:/a:squid-cache:squid:3.3.8
Detected by Squid Detection (HTTP) (OID: 1.3.6.1.4.1.25623.1.0.900611)
```

Summary

Squid is prone to a cache poisoning vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.3.8
Fixed version:     3.5.18
```

Impact

Successful exploitation will allow remote attackers to cause cache poisoning.

Solution:

Solution type: VendorFix

Update to version 3.5.18, 4.0.10 or later.

Affected Software/OS

Squid version 3.2.0.11 through 3.5.17 and 4.x before 4.0.10.

Vulnerability Insight

The flaw exists due to an incorrect data validation of intercepted HTTP Request messages.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

High (CVSS: 8.6)
NVT: Squid 2.0 < 4.14, 5.0.1 < 5.0.5 HTTP Request Smuggling Vulnerability

Product detection result
cpe:/a:squid-cache:squid:3.3.8
Detected by Squid Detection (HTTP) (OID: 1.3.6.1.4.1.25623.1.0.900611)

Summary
Squid is prone to an HTTP request smuggling vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
Installed version: 3.3.8
Fixed version: 4.14
Installation
path / port: 3128/tcp

Solution:
Solution type: VendorFix
Update to version 4.13, 5.0.5 or later. See the referenced vendor advisory for a workaround.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
Squid version 2.0 through 4.13 and 5.0.1 through 5.0.4.

Vulnerability Insight
Due to improper input validation, it allows a trusted client to perform HTTP Request Smuggling and access services otherwise forbidden by the security controls. This occurs for certain uri_whitespace configuration settings.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Squid 2.0 < 4.14, 5.0.1 < 5.0.5 HTTP Request Smuggling Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.145600

NVT: Squid Buffer Overflow Vulnerability (SQUID-2022:2)

Product detection result
```
cpe:/a:squid-cache:squid:3.3.8
Detected by Squid Detection (HTTP) (OID: 1.3.6.1.4.1.25623.1.0.900611)
```

Summary
Squid is prone to a buffer overflow vulnerability in SSPI and SMB authentication.

. . . continues on next page . . .

. . . continued from previous page . . .

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.3.8
Fixed version:     5.7
Installation
path / port:       3128/tcp
```

Impact

This problem allows a remote client to perform a denial of service attack when Squid is configured to use NTLM or Negotiate authentication with one of the vulnerable helpers.
This problem allows a remote client to extract sensitive information from machine memory when Squid is configured to use NTLM or Negotiate authentication with one of the vulnerable helpers. The scope of this information includes user credentials in decrypted forms, and also arbitrary memory areas beyond Squid and the helper itself.
This attack is limited to authentication helpers built using the libntlmauth library shipped by Squid.

Solution:
Solution type: VendorFix
Update to version 5.7 or later.

Affected Software/OS

Squid version 2.5.STABLE1 through 2.7.STABLE9, 3.x through 3.5.28, 4.x through 4.17 and 5.x through 5.6.

Vulnerability Insight

Due to an incorrect integer overflow protection Squid SSPI and SMB authentication helpers are vulnerable to a buffer overflow attack.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.
Details: `Squid Buffer Overflow Vulnerability (SQUID-2022:2)`
OID:1.3.6.1.4.1.25623.1.0.148788

NVT: Squid Multiple DoS Vulnerabilities (SQUID-2016:3, SQUID-2016:4) - Linux

Product detection result
`cpe:/a:squid-cache:squid:3.3.8`
`Detected by Squid Detection (HTTP) (OID: 1.3.6.1.4.1.25623.1.0.900611)`

Summary
Squid is prone to multiple denial of service (DoS) vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.3.8
Fixed version:     3.5.16
```

Impact
Successful exploitation will allow remote HTTP servers to cause a denial of service, or write sensitive information to log files.

Solution:
Solution type: VendorFix
Update to version 3.5.16, 4.0.8 or later.

Affected Software/OS
Squid version 3.x before 3.5.16 and 4.x before 4.0.8.

Vulnerability Insight
Multiple flaws exist due to:
- A buffer overrun in the 'Icmp6::Recv' function in 'icmp/Icmp6.cc' script in the 'pinger' process.
- An incorrect bounds checking while processing HTTP responses.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `Squid Multiple DoS Vulnerabilities (SQUID-2016:3, SQUID-2016:4) - Linux`

```
cpe:/a:openbsd:openssh:7.2p2
Detected by OpenSSH Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.108577)
```

Summary
OpenBSD OpenSSH is prone to a remote code execution (RCE) vulnerability in OpenSSH's forwarded ssh-agent.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.2p2
Fixed version:     9.3p2
Installation
path / port:       22/tcp
```

Solution:
Solution type: VendorFix
Update to version 9.3p2 or later.

Affected Software/OS
OpenBSD OpenSSH prior to version 9.3p2.
The following conditions needs to be met:
- Exploitation requires the presence of specific libraries on the victim system.
- Remote exploitation requires that the agent was forwarded to an attacker-controlled system.

Vulnerability Insight
A condition where specific libraries loaded via ssh-agent(1)'s PKCS#11 support could be abused to achieve remote code execution via a forwarded agent socket.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `OpenBSD OpenSSH < 9.3p2 RCE Vulnerability`

2.67.2 Critical 22/tcp

Critical (CVSS: 9.8)
NVT: OpenBSD OpenSSH < 9.3p2 RCE Vulnerability

Product detection result

```
cpe:/a:openbsd:openssh:8.4p1
Detected by OpenSSH Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.108577)
```

Summary

OpenBSD OpenSSH is prone to a remote code execution (RCE) vulnerability in OpenSSH's forwarded ssh-agent.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.4p1
Fixed version:     9.3p2
Installation
path / port:       22/tcp
```

Solution:

Solution type: VendorFix

Update to version 9.3p2 or later.

Affected Software/OS

OpenBSD OpenSSH prior to version 9.3p2.

The following conditions needs to be met:

- Exploitation requires the presence of specific libraries on the victim system.
- Remote exploitation requires that the agent was forwarded to an attacker-controlled system.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

A condition where specific libraries loaded via ssh-agent(1)'s PKCS#11 support could be abused to achieve remote code execution via a forwarded agent socket.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `OpenBSD OpenSSH < 9.3p2 RCE Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.104869

Solution:
Solution type: VendorFix
- Update Apache Tomcat to version 7.0.100, 8.5.51, 9.0.31 or later
- For other products using Tomcat please contact the vendor for more information on fixed versions

Affected Software/OS
Apache Tomcat versions prior 7.0.100, 8.5.51 or 9.0.31 when the AJP connector is enabled.
Other products like JBoss or Wildfly which are using Tomcat might be affected as well.

Vulnerability Insight
Apache Tomcat server has a file containing vulnerability, which can be used by an attacker to read or include any files in all webapp directories on Tomcat, such as webapp configuration files or source code.

Vulnerability Detection Method
Sends a crafted AJP request and checks the response.

NVT: MongoDB Certificate Validation Vulnerability (SERVER-72839) - Linux

Summary
MongoDB is prone to a certificate validation vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.4.24
Fixed version:     4.4.29
```

Solution:
Solution type: VendorFix
Update to version 4.4.29, 5.0.25, 6.0.14, 7.0.6 or later.

Affected Software/OS
MongoDB version 3.2.6 through 4.4.28, 5.x through 5.0.24, 5.1.x through 6.0.13 and 6.1.x through 7.0.5.

Vulnerability Insight
Under certain configurations of –tlsCAFile and tls.CAFile, MongoDB Server may skip peer certificate validation which may result in untrusted connections to succeed. This may effectively reduce the security guarantees provided by TLS and open connections that should have been closed due to failing certificate validation.

. . . continues on next page . . .

. . . continued from previous page . . .

Required Configuration: A server process will allow incoming connections to skip peer certificate validation if the server process was started with TLS enabled (net.tls.mode set to allowTLS, preferTLS, or requireTLS) and without a net.tls.CAFile configured.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `MongoDB Certificate Validation Vulnerability (SERVER-72839) - Linux`
OID:1.3.6.1.4.1.25623.1.0.151888
Version used: `2026-01-09T05:47:51Z`

Service (Port)	Threat Level
27017/tcp	Critical

2.72.1 Critical 27017/tcp

Critical (CVSS: 9.8)
NVT: MongoDB Certificate Validation Vulnerability (SERVER-72839) - Linux

Summary
MongoDB is prone to a certificate validation vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 3.2.21
Fixed version:     4.4.29
```

. . . continues on next page . . .

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to version 4.4.29, 5.0.25, 6.0.14, 7.0.6 or later.

Affected Software/OS
MongoDB version 3.2.6 through 4.4.28, 5.x through 5.0.24, 5.1.x through 6.0.13 and 6.1.x through 7.0.5.

Vulnerability Insight
Under certain configurations of –tlsCAFile and tls.CAFile, MongoDB Server may skip peer certificate validation which may result in untrusted connections to succeed. This may effectively reduce the security guarantees provided by TLS and open connections that should have been closed due to failing certificate validation.
Required Configuration: A server process will allow incoming connections to skip peer certificate validation if the server process was started with TLS enabled (net.tls.mode set to allowTLS, preferTLS, or requireTLS) and without a net.tls.CAFile configured.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Critical (CVSS: 9.7)
NVT: Python Multiple Vulnerabilities (Jun 2025) - Linux

Product detection result
`cpe:/a:python:python:3.11.10`
`Detected by Python Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.112857)`

Summary
Python is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.11.10
Fixed version:     3.11.13
Installation
path / port:       5000/tcp
```

Solution:
Solution type: VendorFix
Update to version 3.9.23, 3.10.18, 3.11.13, 3.12.11, 3.13.4 or later.

Affected Software/OS
Python versions prior to 3.9.23, 3.10.x prior to 3.10.18, 3.11.x prior to 3.11.13, 3.12.x prior to 3.12.11 and 3.13.x prior to 3.13.4.

Vulnerability Insight
The following flaws exist:
- CVE-2024-12718: Allows modifying some file metadata (e.g. last modified) with filter='data' or file permissions (chmod) with filter='tar' of files outside the extraction directory.
- CVE-2025-4138: Allows creating arbitrary symlinks outside the extraction directory during extraction with filter='data'.
- CVE-2025-4330: Allows the extraction filter to be ignored, allowing symlink targets to point outside the destination directory, and the modification of some file metadata.
- CVE-2025-4435: Filtered members not skipped with TarFile.errorlevel = 0
- CVE-2025-4517: Allows arbitrary filesystem writes outside the extraction directory during extraction with filter='data'.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Python DoS Vulnerability (Dec 2025) - Linux

Product detection result

```
cpe:/a:python:python:3.11.10
Detected by Python Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.112857)
```

Summary

Python is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.11.10
Fixed version:     3.13.11
Installation
path / port:       5000/tcp
```

Solution:

Solution type: VendorFix

Update to version 3.14.1 or later, or to the latest maintenance release of your Python version series (3.10.x, 3.12.x) once patches are available. Please see the references for more information.

Affected Software/OS

Python prior to version 3.13.11 and 3.14.x prior to 3.14.1.

Note: Fixes have been backported to maintenance branches (3.10, 3.12) but specific patch versions are not yet available.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
When reading an HTTP response from a server, if no read amount is specified, the default behavior will be to use Content-Length. This allows a malicious server to cause the client to read large amounts of data into memory, potentially causing out-of-memory (OOM) or other DoS conditions.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
