Scan Report

January 26, 2026

Summary

This document reports on the results of an automatic security scan. All dates are displayed using the timezone "Coordinated Universal Time", which is abbreviated "UTC". The task was " hgdfdghgdgd". The scan started at Mon Jan 26 01:47:47 2026 UTC and ended at Mon Jan 26 14:04:13 2026 UTC. The report first summarises the results found. Then, for each host, the report describes every issue found. Please consider the advice given in each description, in order to rectify the issue.

cpe:/a:php:php:7.2.14
Detected by PHP Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.171722)
```

Summary
PHP is improperly validating input from untrusted input.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 7.2.14
Fixed version:     None
Installation
path / port:       80/tcp
```

Solution:
Solution type: WillNotFix
No solution was made available by the vendor. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.
Note: PHP versions 7.0.18 and 7.1.4 introduced a fix which was reverted again in version 7.0.19 / 7.1.5 respectively and the fix wasn't introduced again as of today (08-2020).

Affected Software/OS
All PHP versions since 4.3.0 up to the latest 7.x versions.
Note: PHP versions 7.0.18 and 7.1.4 introduced a fix which was reverted again in version 7.0.19 / 7.1.5 respectively.

Vulnerability Insight
main/streams/xp_socket.c in PHP misparses fsockopen calls, such as by interpreting fsockopen('127.0.0.1:80', 443) as if the address/port were 127.0.0.1:80:443, which is later truncated to 127.0.0.1:80. This behavior has a security risk if the explicitly provided port number (i.e., 443 in this example) is hardcoded into an application as a security policy, but the hostname argument (i.e., 127.0.0.1:80 in this example) is obtained from untrusted input.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Vulnerability Detection Result

```
Installed version: 4.8.5
Fixed version:     4.9.5
Installation

Impact
Successful exploitation would allow an attacker to:
- create a specially-crafted username and then trick the victim in to performing specific actions with that user account (such as editing its privileges)
- generate specially-crafted database or table names
- insert specially-crafted data in to certain database tables, which when retrieved (for instance, through the Browse tab) can trigger an XSS attack

Solution:
Solution type: VendorFix
Update to version 4.9.5, 5.0.2 or later.

Affected Software/OS
phpMyAdmin prior to version 4.9.5 and 5.x prior to 5.0.2.

Vulnerability Insight
The following SQL injection vulnerabilities exist:
- An SQL injection vulnerability was found in how phpMyAdmin retrieves the current username

. . . continues on next page . . .

Solution:
Solution type: WillNotFix
No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS

. . . continues on next page . . .

. . . continued from previous page . . .

phpMyAdmin version 5.1.1 and prior.

Vulnerability Insight
NOTE: the vendor disputes this because 'the CSV file is accurately generated based on the database contents.'
Nevertheless the vendor could implement measures while doing the CSV export which could lower or mitigate the risk originating from this flaw.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

NVT: Cleartext Transmission of Sensitive Information via HTTP

Summary
The host / application transmits sensitive information (username, passwords) in cleartext via HTTP.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
`The following input fields were identified (URL:input name):`
`http://pma48.trabalho_vulnnet/:pma_password`

Impact
An attacker could use this situation to compromise or eavesdrop on the HTTP communication between the client and the server using a man-in-the-middle attack to get access to sensitive data like usernames or passwords.

Solution:
Solution type: Workaround
Enforce the transmission of sensitive data via an encrypted SSL/TLS connection. Additionally make sure the host / application is redirecting all users to the secured SSL/TLS connection before allowing to input sensitive data into the mentioned functions.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
Hosts / applications which doesn't enforce the transmission of sensitive data via an encrypted SSL/TLS connection.

Vulnerability Detection Method
Evaluate previous collected information and check if the host / application is not enforcing the transmission of sensitive data via an encrypted SSL/TLS connection.
The script is currently checking the following:
- HTTP Basic Authentication (Basic Auth)
- HTTP Forms (e.g. Login) with input field of type 'password'

```

Solution:
Solution type: VendorFix
Update to version 3.5.0 or later.

Affected Software/OS
jQuery versions starting from 1.0.3 and prior to version 3.5.0.

Vulnerability Insight
Passing HTML containing <option> elements from untrusted sources - even after sanitizing them - to one of jQuery's DOM manipulation methods (i.e. .html(), .append(), and others) may execute untrusted code.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Medium (CVSS: 6.1)
NVT: jQuery < 3.4.0 Object Extensions Vulnerability

Summary
jQuery is prone to multiple vulnerabilities regarding property injection in Object.prototype.

Quality of Detection (QoD): 30%

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Detection Result

```
Installed version: 3.3.1
Fixed version:     3.4.0
Installation
path / port:       /js/vendor/jquery/jquery.min.js
Detection info (see OID: 1.3.6.1.4.1.25623.1.0.150658 for more info):
- Identified file: http://pma48.trabalho_vulnnet/js/vendor/jquery/jquery.min.js
- Referenced at:   http://pma48.trabalho_vulnnet/
```

Solution:
Solution type: VendorFix
Update to version 3.4.0 or later. Patch diffs are available for older versions.

Affected Software/OS
jQuery prior to version 3.4.0.

Vulnerability Insight
The following flaws exist:
- CVE-2019-5428: A prototype pollution vulnerability exists that allows an attacker to inject properties on Object.prototype.
- CVE-2019-11358: jQuery mishandles jQuery.extend(true, }}, ...) because of Object.prototype pollution. If an unsanitized source object contained an enumerable __proto__ property, it could extend the native Object.prototype.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Medium (CVSS: 6.1)
NVT: jQuery < 3.4.0 Object Extensions Vulnerability

Summary
jQuery is prone to multiple vulnerabilities regarding property injection in Object.prototype.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 3.1.1
Fixed version:     3.4.0
Installation
path / port:       /doc/html/_static/jquery.js
Detection info (see OID: 1.3.6.1.4.1.25623.1.0.150658 for more info):
- Identified file: http://pma48.trabalho_vulnnet/doc/html/_static/jquery.js
- Referenced at:   http://pma48.trabalho_vulnnet/doc/html/
```

Solution:
Solution type: VendorFix
Update to version 3.4.0 or later. Patch diffs are available for older versions.

Affected Software/OS
jQuery prior to version 3.4.0.

Vulnerability Insight
The following flaws exist:
- CVE-2019-5428: A prototype pollution vulnerability exists that allows an attacker to inject properties on Object.prototype.
- CVE-2019-11358: jQuery mishandles jQuery.extend(true, }}, ...) because of Object.prototype pollution. If an unsanitized source object contained an enumerable __proto__ property, it could extend the native Object.prototype.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
If a password stored with password_hash starts with a null byte (\x00), testing a blank string as the password via password_verify will incorrectly return true.
If a user were able to create a password with a leading null byte (unlikely, but syntactically valid), an attacker could trivially compromise the victim's account by attempting to sign in with a blank string.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Solution:
Solution type: VendorFix
Update to phpMyAdmin version 4.9.1 or later.

Affected Software/OS
phpMyAdmin version 4.9.0.1 and prior.

Vulnerability Insight
A CSRF issue in phpMyAdmin allows deletion of any server in the Setup page.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

2.1.3 Low general/tcp

Low (CVSS: 2.6)
NVT: TCP Timestamps Information Disclosure

Summary
The remote host implements TCP timestamps and therefore allows to compute the uptime.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
```
It was detected that the host implements RFC1323/RFC7323.
The following timestamps were retrieved with a delay of 1 seconds in-between:
Packet 1: 921712338
```

. . . continues on next page . . .

. . . continued from previous page . . .

```
Packet 2: 921713445
```

Impact
A side effect of this feature is that the uptime of the remote host can sometimes be computed.

Solution:
Solution type: Mitigation
To disable TCP timestamps on linux add the line 'net.ipv4.tcp_timestamps = 0' to /etc/sysctl.conf. Execute 'sysctl -p' to apply the settings at runtime.
To disable TCP timestamps on Windows execute 'netsh int tcp set global timestamps=disabled' Starting with Windows Server 2008 and Vista, the timestamp can not be completely disabled.
The default behavior of the TCP/IP stack on this Systems is to not use the Timestamp options when initiating TCP connections, but use them if the TCP peer that is initiating communication includes them in their synchronize (SYN) segment.
See the references for more information.

Affected Software/OS
TCP implementations that implement RFC1323/RFC7323.

Vulnerability Insight
The remote host implements TCP timestamps, as defined by RFC1323/RFC7323.

Vulnerability Detection Method
Special IP packets are forged and sent with a little delay in between to the target IP. The responses are searched for a timestamps. If found, the timestamps are reported.
Details: `TCP Timestamps Information Disclosure`

2.1.4 Low general/icmp

Low (CVSS: 2.1)
NVT: ICMP Timestamp Reply Information Disclosure

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

The remote host responded to an ICMP timestamp request.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The following response / ICMP packet has been received:
- ICMP Type: 14
- ICMP Code: 0
```

Impact

This information could theoretically be used to exploit weak time-based random number generators in other services.

Solution:

Solution type: Mitigation

Various mitigations are possible:

- Disable the support for ICMP timestamp on the remote host completely
- Protect the remote host by a firewall, and block ICMP packets passing through the firewall in either direction (either completely or only for untrusted networks)

Vulnerability Insight

The Timestamp Reply is an ICMP message which replies to a Timestamp message. It consists of the originating timestamp sent by the sender of the Timestamp as well as a receive timestamp and a transmit timestamp.

Vulnerability Detection Method

Sends an ICMP Timestamp (Type 13) request and checks if a Timestamp Reply (Type 14) is received.

Details: `ICMP Timestamp Reply Information Disclosure`

2.1.9 Log general/CPE-T

Log (CVSS: 0.0)
NVT: CPE Inventory

Summary
This routine uses information collected by other routines about CPE identities of operating systems, services and applications detected during the scan.
Note: Some CPEs for specific products might show up twice or more in the output. Background: After a product got renamed or a specific vendor was acquired by another one it might happen that a product gets a new CPE within the NVD CPE Dictionary but older entries are kept with the older CPE.
